*Fall program Interactions between Partial Differential Equations & Functional Inequalities*

Stockholm, September 1st – December 16, 2016
Outline

▷ Interpolation inequalities on the sphere

▷ Caffarelli-Kohn-Nirenberg inequalities: the bifurcation point of view

▷ Gagliardo-Nirenberg and Caffarelli-Kohn-Nirenberg inequalities: an approach based on nonlinear flows
Interpolation inequalities on the sphere

▷ A spectral point of view on fractional and non-fractional interpolation inequalities

▷ The bifurcation point of view

▷ Flows on the sphere
  • Carré du champ
  • Can one prove Sobolev’s inequalities with a heat flow?
  • Some open problems: constraints and improved inequalities

[Beckner, 1993], [J.D., Zhang, 2016]
[Bakry, Emery, 1984]
[Bidault-Véron, Véron, 1991], [Bakry, Ledoux, 1996]
[Demange, 2008][J.D., Esteban, Loss, 2014 & 2015]
Non-fractional interpolation inequalities

On the \( d \)-dimensional sphere, let us consider the interpolation inequality

\[
\| \nabla u \|_{L^2(S^d)}^2 + \frac{d}{p-2} \| u \|_{L^2(S^d)}^2 \geq \frac{d}{p-2} \| u \|_{L^p(S^d)}^2 \quad \forall u \in H^1(S^d, d\mu)
\]

where the measure \( d\mu \) is the uniform probability measure on \( S^d \subset \mathbb{R}^{d+1} \) induced by the Lebesgue measure on \( \mathbb{R}^{d+1} \)

\[
1 \leq p < 2 \quad \text{or} \quad 2 < p \leq 2^* := \frac{2d}{d-2}
\]

if \( d \geq 3 \). We adopt the convention that \( 2^* = \infty \) if \( d = 1 \) or \( d = 2 \). The case \( p = 2 \) corresponds to the logarithmic Sobolev inequality

\[
\| \nabla u \|_{L^2(S^d)}^2 \geq \frac{d}{2} \int_{S^d} |u|^2 \log \left( \frac{|u|^2}{\| u \|_{L^2(S^d)}^2} \right) \ d\mu \quad \forall u \in H^1(S^d, d\mu) \setminus \{0\}
\]
Optimal interpolation inequalities for fractional operators

- The sharp *Hardy-Littlewood-Sobolev inequality on \( S^n \) [Lieb, 1983]

\[
\int \int_{S^n \times S^n} F(\zeta) |\zeta - \eta|^{-\lambda} F(\eta) \, d\mu(\zeta) \, d\mu(\eta) \leq \frac{\Gamma(n) \Gamma\left(\frac{n-\lambda}{2}\right)}{2^\lambda \Gamma\left(\frac{n}{2}\right) \Gamma\left(\frac{n}{p}\right)} \|F\|_{L^p(S^n)}^2
\]

\( \lambda \in (0, n) \), \( p = \frac{2n}{2n-\lambda} \in (1, 2) \)

\( \lambda = \frac{2n}{q_*} \) where \( \frac{1}{p} + \frac{1}{q_*} = 1 \)

- A *subcritical interpolation inequality*

\( d\mu \) is the uniform probability measure on \( S^n \)

\( \mathcal{L}_s \) is the fractional Laplace operator of order \( s \in (0, n) \)

\( q \in [1, 2) \cup (2, q_*] \), \( q_* = \frac{2n}{n-s} \)

\[
\frac{\|F\|_{L^q(S^n)}^2 - \|F\|_{L^2(S^n)}^2}{q - 2} \leq C_{q,s} \int_{S^n} F \mathcal{L}_s F \, d\mu \quad \forall F \in H^{s/2}(S^n)
\]
The sharp constants

**Theorem**

[J.D., Zhang] Let \( n \geq 1 \). If either \( s \in (0, n] \), \( q \in [1, 2) \cup (2, q_*) \), or \( s = n \) and \( q \in [1, 2) \cup (2, \infty) \), then

\[
C_{q,s} = \frac{n-s}{2s} \frac{\Gamma\left(\frac{n-s}{2}\right)}{\Gamma\left(\frac{n+s}{2}\right)}
\]

\[
C_{q,s}^{-1} = \lambda_1(\mathcal{L}_s) = \inf_{F \in H^{s/2}(S^n) \setminus \mathbb{R}} Q[F], \quad Q[F] := \frac{(q - 2) \int_{S^n} F \mathcal{L}_s F \, d\mu}{\|F\|_{L^2(S^n)}^2 - \|F\|_{L^q(S^n)}^2}
\]

*Sharp subcritical fractional logarithmic Sobolev inequalities*

**Corollary**

[J.D., Zhang] Let \( s \in (0, n] \)

\[
\int_{S^n} |F|^2 \log \left( \frac{|F|}{\|F\|_{L^2(S^n)}} \right) \, d\mu \leq C_{2,s} \int_{S^n} F \mathcal{L}_s F \, d\mu \quad \forall F \in H^{s/2}(S^n)
\]
From HLS to Sobolev

Lieb’s approach... Decomposition on spherical harmonics:
\[ F = \sum_{k=0}^{\infty} F(k) \]
Funk-Hecke formula

\[
\int \int_{\mathbb{S}^n \times \mathbb{S}^n} F(\zeta) |\zeta - \eta|^{-\lambda} F(\eta) \, d\mu(\zeta) \, d\mu(\eta)
\]

\[
= \frac{\Gamma(n) \Gamma\left(\frac{n-\lambda}{2}\right)}{2^\lambda \Gamma\left(\frac{n}{2}\right) \Gamma\left(\frac{n}{p}\right)} \sum_{k=0}^{\infty} \frac{\Gamma\left(\frac{n}{p}\right) \Gamma\left(\frac{n}{p'} + k\right)}{\Gamma\left(\frac{n}{p'}\right) \Gamma\left(\frac{n}{p} + k\right)} \int_{\mathbb{S}^n} |F(k)|^2 \, d\mu
\]

The fractional Sobolev inequality

\[
\|F\|_{L_{q_*}(\mathbb{S}^n)}^2 \leq \int_{\mathbb{S}^n} F \mathcal{K}_s F \, d\mu := \sum_{k=0}^{\infty} \gamma_k\left(\frac{n}{q_*}\right) \int_{\mathbb{S}^n} |F(k)|^2 \, d\mu
\]

is dual of HLS, where \( q_* = \frac{2n}{n - s} \) is the critical exponent and

\[
\gamma_k(x) := \frac{\Gamma(x) \Gamma(n - x + k)}{\Gamma(n - x) \Gamma(x + k)} = \frac{(n + k - 1 - x)(n + k - 2 - x) \ldots (n - x)}{(k - 1 + x)(k - 2 + x) \ldots x}
\]
The subcritical inequalities

\[ \mathcal{L}_s := \frac{1}{\kappa_{n,s}} (\mathcal{K}_s - \text{Id}) \quad \text{with} \quad \kappa_{n,s} := \frac{\Gamma \left( \frac{n}{q} \right)}{\Gamma \left( \frac{n - n}{q} \right)} = \frac{\Gamma \left( \frac{n - s}{2} \right)}{\Gamma \left( \frac{n + s}{2} \right)} \]

Subcritical interpolation inequalities: \( q \in [1, 2) \cup (2, q_\star] \)

\[ \frac{\| F \|_{L^q(S^n)}^2 - \| F \|_{L^2(S^n)}^2}{q - 2} \leq C_{q,s} \int_{S^n} F \mathcal{L}_s F \, d\mu \quad \forall F \in H^{s/2}(S^n) \]

Lemma

[J.D., Zhang] For any \( n \geq 1 \), the function \( q \mapsto \frac{\gamma_k \left( \frac{n}{q} \right) - 1}{q - 2} \) is monotone increasing on \( (1, \infty) \) for any \( k \geq 2 \)

[Beckner, 1993]: if \( q \in (2, q_\star(2)] \), \( q_\star(2) = 2 \frac{n}{n - 2} \), then

\[ \delta_k(x) = \frac{1}{\kappa_{n,s}} \left( \gamma_k \left( \frac{n}{q} \right) - 1 \right) =: \delta_k \left( \frac{n}{q} \right) \leq \delta_k \left( \frac{n}{q_\star} \right) = k \left( k + n - 1 \right) \]

results in \( \| F \|_{L^q(S^n)}^2 - \| F \|_{L^2(S^n)}^2 \leq \frac{q - 2}{n} \| \nabla F \|_{L^2(S^n)}^2 \)
The optimal constant $C_{q,s}$ is independent of $q$ and determined for any given $s$ by the critical case $q = q_\star(s)$ which corresponds to the Hardy-Littlewood-Sobolev inequality if $s \in (-n, 0)$ and to the Sobolev inequality if $s \in (0, n)$.

The case $s = 0$ corresponds to the critical fractional logarithmic Sobolev inequality if $s = 0$ [Beckner, 1993] and the subcritical fractional logarithmic Sobolev inequality if $s \in (0, n)$. 
Sketch of the proof

$q \mapsto \gamma_k(n/q)$ is strictly convex with respect to $q$ iff

$$x \gamma_k'' + 2 \gamma_k' > 0 \quad \forall x \in (0, n)$$

$$\iff \alpha_k(x) := -\frac{\gamma_k'(x)}{\gamma_k(x)} = \sum_{j=0}^{k-1} \beta_j(x) \text{ with } \beta_j(x) = \frac{1}{n+j-x} + \frac{1}{j+x} \text{ solves }$$

$$\alpha_k^2 - \alpha_k' - \frac{2}{x} \alpha_k > 0$$

▷ A proof by induction: from

$$\alpha_k^2 \geq 2 \beta_0 \sum_{j=1}^{k-1} \beta_j + \sum_{j=0}^{k-1} \beta_j^2$$

$$\beta_0^2 - \beta_0' - \frac{2}{x} \beta_0 = 0$$

and

$$2 \beta_0 \beta_j + \beta_j'^2 - \beta_j' - \frac{2}{x} \beta_j = \frac{2(n+j)(n+2j)}{(n-x)(n+j-x)(j+x)^2}$$

we deduce that

$$\alpha_k^2 - \alpha_k' - \frac{2}{x} \alpha_k \geq \sum_{j=1}^{k-1} \frac{2(n+j)(n+2j)}{(n-x)(j+n-x)(j+x)^2} \quad \forall k \geq 2$$
On the $d$-dimensional sphere, let us consider the interpolation inequality

$$\|\nabla u\|^2_{L^2(S^d)} + \frac{d}{p-2} \|u\|^2_{L^2(S^d)} \geq \frac{d}{p-2} \|u\|^2_{L^p(S^d)} \quad \forall u \in H^1(S^d, d\mu)$$

where the measure $d\mu$ is the uniform probability measure on $S^d \subset \mathbb{R}^{d+1}$ corresponding to the measure induced by the Lebesgue measure on $\mathbb{R}^{d+1}$, and the exposant $p \geq 1$, $p \neq 2$, is such that

$$p \leq 2^* := \frac{2d}{d-2}$$

if $d \geq 3$. We adopt the convention that $2^* = \infty$ if $d = 1$ or $d = 2$. The case $p = 2$ corresponds to the logarithmic Sobolev inequality

$$\|\nabla u\|^2_{L^2(S^d)} \geq \frac{d}{2} \int_{S^d} |u|^2 \log \left( \frac{|u|^2}{\|u\|^2_{L^2(S^d)}} \right) d\mu \quad \forall u \in H^1(S^d, d\mu) \setminus \{0\}$$
The Bakry-Emery method

**Entropy functional**

\[ E_p[\rho] := \frac{1}{p-2} \left[ \int_{S^d} \rho^{\frac{2}{p}} \, d\mu - \left( \int_{S^d} \rho \, d\mu \right)^{\frac{2}{p}} \right] \quad \text{if} \quad p \neq 2 \]

\[ E_2[\rho] := \int_{S^d} \rho \log \left( \frac{\rho}{\|\rho\|_{L^1(S^d)}} \right) \, d\mu \]

**Fisher information functional**

\[ I_p[\rho] := \int_{S^d} |\nabla \rho^{\frac{1}{p}}|^2 \, d\mu \]

Bakry-Emery (carré du champ) method: use the heat flow

\[ \frac{\partial \rho}{\partial t} = \Delta \rho \]

and compute \( \frac{d}{dt} E_p[\rho] = -I_p[\rho] \) and \( \frac{d}{dt} I_p[\rho] \leq -d I_p[\rho] \) to get

\[ \frac{d}{dt} (I_p[\rho] - d E_p[\rho]) \leq 0 \quad \Rightarrow \quad I_p[\rho] \geq d E_p[\rho] \]

with \( \rho = |u|^p \), if \( p \leq 2\# := \frac{2d^2 + 1}{(d-1)^2} \)
The evolution under the fast diffusion flow

To overcome the limitation $p \leq 2^*$, one can consider a nonlinear diffusion of fast diffusion / porous medium type

$$\frac{\partial \rho}{\partial t} = \Delta \rho^m. \quad (1)$$

[Demange], [J.D., Esteban, Kowalczyk, Loss]: for any $p \in [1, 2^*]

$$\mathcal{K}_p[\rho] := \frac{d}{dt} \left( I_p[\rho] - d \mathcal{E}_p[\rho] \right) \leq 0$$

$(p, m)$ admissible region, $d = 5$
Cylindrical coordinates, Schwarz symmetrization, stereographic projection...
... and the ultra-spherical operator

Change of variables $z = \cos \theta$, $\nu(\theta) = f(z)$, $d\nu_d := \nu^{d-1} d\theta / Z_d$, $\nu(z) := 1 - z^2$

The self-adjoint \textit{ultraspherical} operator is

$$\mathcal{L} f := (1 - z^2) f'' - d z f' = \nu f'' + \frac{d}{2} \nu f'$$

which satisfies $\langle f_1, \mathcal{L} f_2 \rangle = -\int_{-1}^{1} f_1' f_2' \nu \, d\nu_d$

**Proposition**

Let $p \in [1, 2) \cup (2, 2^*)$, $d \geq 1$. For any $f \in H^1([-1, 1], d\nu_d)$,

$$-\langle f, \mathcal{L} f \rangle = \int_{-1}^{1} |f'|^2 \nu \, d\nu_d \geq d \frac{\|f\|_{L^p(S^d)}^2 - \|f\|_{L^2(S^d)}^2}{p - 2}$$
The heat equation $\frac{\partial g}{\partial t} = \mathcal{L} g$ for $g = f^p$ can be rewritten in terms of $f$ as

$$\frac{\partial f}{\partial t} = \mathcal{L} f + (p - 1) \frac{|f'|^2}{f} \nu$$

$$-\frac{1}{2} \frac{d}{dt} \int_{-1}^{1} |f'|^2 \nu \, d\nu = \frac{1}{2} \frac{d}{dt} \langle f, \mathcal{L} f \rangle = \langle \mathcal{L} f, \mathcal{L} f \rangle + (p-1) \left\langle \frac{|f'|^2}{f}, \nu, \mathcal{L} f \right\rangle$$

$$\frac{d}{dt} \mathcal{I}[g(t, \cdot)] + 2d \mathcal{I}[g(t, \cdot)] = \frac{d}{dt} \int_{-1}^{1} |f'|^2 \nu \, d\nu + 2d \int_{-1}^{1} |f'|^2 \nu \, d\nu$$

$$= -2 \int_{-1}^{1} \left( |f''|^2 + (p - 1) \frac{d}{d+2} \frac{|f'|^4}{f^2} - 2(p - 1) \frac{d - 1}{d+2} \frac{|f'|^2 f''}{f} \right) \nu^2 \, d\nu$$

is nonpositive if

$$|f''|^2 + (p - 1) \frac{d}{d+2} \frac{|f'|^4}{f^2} - 2(p - 1) \frac{d - 1}{d+2} \frac{|f'|^2 f''}{f}$$

is pointwise nonnegative, which is granted if

$$\left[ (p - 1) \frac{d - 1}{d+2} \right]^2 \leq (p-1) \frac{d}{d+2} \iff p \leq \frac{2d^2 + 1}{(d-1)^2} = 2^# < \frac{2d}{d-2} = 2^*$$
The range $2^# < p \leq 2^*$ is covered using the adapted fast diffusion eq.

\[
\frac{\partial \rho}{\partial t} = \Delta \rho^m
\]
\[
\rho = |u|^{\beta p}
\]
\[
m = 1 + \frac{2}{p} \left( \frac{1}{\beta} - 1 \right)
\]

$(p, \beta)$ representation of the admissible range of parameters when $d = 5$

[J.D., Esteban, Kowalczyk, Loss]
Can one prove Sobolev’s inequalities with a heat flow?

\((p, \beta)\) representation when \(d = 5\). In the dark grey area, the functional is not monotone under the action of the heat flow [J.D., Esteban, Loss].
The bifurcation point of view

\( \mu(\lambda) \) is the optimal constant in the functional inequality

\[
\| \nabla u \|^2_{L^2(S^d)} + \lambda \| u \|^2_{L^2(S^d)} \geq \mu(\lambda) \| u \|^2_{L^p(S^d)} \quad \forall u \in H^1(S^d, d\mu)
\]

Here \( d = 3 \) and \( p = 4 \)
A critical point of $u \mapsto Q_\lambda[u] := \frac{\|\nabla u\|_{L^2(S^d)}^2 + \lambda \|u\|_{L^2(S^d)}^2}{\|u\|_{L^p(S^d)}^2}$ solves

$$-\Delta u + \lambda u = |u|^{p-2} u$$

up to a multiplication by a constant (and a conformal transformation if $p = 2^*$)

The best constant $\mu(\lambda) = \inf_{u \in H^1(S^d, d\mu) \setminus \{0\}} Q_\lambda[u]$ is such that $\mu(\lambda) < \lambda$ if $\lambda > \frac{d}{p-2}$, and $\mu(\lambda) = \lambda$ if $\lambda \leq \frac{d}{p-2}$ so that

$$\frac{d}{p-2} = \min\{\lambda > 0 : \mu(\lambda) < \lambda\}$$

Rigidity: the unique positive solution of (EL) is $u = \lambda^{1/(p-2)}$ if $\lambda \leq \frac{d}{p-2}$
Taylor expansion:

\[ d = \inf_{u \in \mathcal{H}^1(S^d, d\mu) \setminus \{0\}} \frac{(p - 2) \| \nabla u \|^2_{L^2(S^d)}}{\| u \|^2_{L^p(S^d)} - \| u \|^2_{L^2(S^d)}} \]

is achieved in the limit as \( \varepsilon \to 0 \) with \( u = 1 + \varepsilon \varphi_1 \) such that

\[-\Delta \varphi_1 = d \varphi_1\]

This suggest that improved inequalities can be obtained under appropriate orthogonality constraints...
Integral constraints

With the heat flow...

Proposition

For any $p \in (2, 2^\#)$, the inequality

$$
\int_{-1}^{1} |f'|^2 \nu \, d\nu_d + \frac{\lambda}{p-2} \|f\|_2^2 \geq \frac{\lambda}{p-2} \|f\|_p^2
$$

\forall f \in H^1((-1, 1), d\nu_d) \text{ s.t. } \int_{-1}^{1} z |f|^p \, d\nu_d = 0

holds with

$$
\lambda \geq d + \frac{(d-1)^2}{d(d+2)} (2^\# - p) (\lambda^* - d)
$$

... and with a nonlinear diffusion flow?
Antipodal symmetry

With the additional restriction of antipodal symmetry, that is

$$u(-x) = u(x) \quad \forall x \in \mathbb{S}^d$$

**Theorem**

If $p \in (1, 2) \cup (2, 2^*)$, we have

$$\int_{\mathbb{S}^d} |\nabla u|^2 \, d\mu \geq \frac{d}{p-2} \left[ 1 + \frac{(d^2 - 4)(2^*-p)}{d(d+2) + p - 1} \right] \left( \|u\|_{L^p(\mathbb{S}^d)}^2 - \|u\|_{L^2(\mathbb{S}^d)}^2 \right)$$

for any $u \in H^1(\mathbb{S}^d, d\mu)$ with antipodal symmetry. The limit case $p = 2$ corresponds to the improved logarithmic Sobolev inequality

$$\int_{\mathbb{S}^d} |\nabla u|^2 \, d\mu \geq \frac{d(d+3)^2}{2(d+1)^2} \int_{\mathbb{S}^d} |u|^2 \log \left( \frac{|u|^2}{\|u\|^2_{L^2(\mathbb{S}^d)}} \right) d\mu$$
The larger picture: branches of antipodal solutions

Case $d = 5$, $p = 3$: values of the shooting parameter $a$ as a function of $\lambda$
Numerical computation of the optimal constant when \( d = 5 \) and \( 1 \leq p \leq 10/3 \approx 3.33 \). The limiting value of the constant is numerically found to be equal to \( \lambda_\star = 2^{1-2/p} d \approx 6.59754 \) with \( d = 5 \) and \( p = 10/3 \).
Symmetries, symmetry breaking and bifurcations in Caffarelli-Kohn-Nirenberg inequalities

- Symmetry, symmetry breaking and branches of solutions
- The sharp result on symmetry
- Bifurcation and branches
Critical Caffarelli-Kohn-Nirenberg inequalities

Let $D_{a,b} := \left\{ v \in L^p \left( \mathbb{R}^d, |x|^{-b} \, dx \right) : |x|^{-a} |\nabla v| \in L^2 \left( \mathbb{R}^d, dx \right) \right\}$

$$\left( \int_{\mathbb{R}^d} \frac{|v|^p}{|x|^{bp}} \, dx \right)^{2/p} \leq C_{a,b} \int_{\mathbb{R}^d} \frac{|\nabla v|^2}{|x|^{2a}} \, dx \quad \forall \, v \in D_{a,b}$$

holds under the conditions that $a \leq b \leq a + 1$ if $d \geq 3$, $a < b \leq a + 1$ if $d = 2$, $a + 1/2 < b \leq a + 1$ if $d = 1$, and $a < a_c := (d - 2)/2$

$$p = \frac{2d}{d - 2 + 2(b - a)} \quad \text{(critical case)}$$

▷ An optimal function among radial functions:

$$v_*(x) = \left( 1 + |x|^{(p-2)(a_c-a)} \right)^{-\frac{2}{p-2}} \quad \text{and} \quad C_{a,b}^* = \frac{\| |x|^{-b} v_* \|_p^2}{\| |x|^{-a} \nabla v_* \|_2^2}$$

Question: $C_{a,b} = C_{a,b}^*$ (symmetry) or $C_{a,b} > C_{a,b}^*$ (symmetry breaking)?
Critical CKN: range of the parameters

Figure: \(d = 3\)

\[
\left( \int_{\mathbb{R}^d} \frac{|v|^p}{|x|^b p} \, dx \right)^{2/p} \leq C_{a,b} \int_{\mathbb{R}^d} \frac{|\nabla v|^2}{|x|^{2a}} \, dx
\]

- \(a \leq b \leq a + 1\) if \(d \geq 3\)
- \(a < b \leq a + 1\) if \(d = 2\), \(a + 1/2 < b \leq a + 1\) if \(d = 1\)
- and \(a < a_c := (d - 2)/2\)

\[
p = \frac{2d}{d - 2 + 2(b - a)}
\]

Symmetry \textit{versus} symmetry breaking: the sharp result

A result based on entropies and nonlinear flows

\[ J.D., \text{ Esteban, Loss, 2015}] : \text{http://arxiv.org/abs/1506.03664} \]
The Felli & Schneider curve is defined by

\[ b_{FS}(a) := \frac{d(a_c - a)}{2\sqrt{(a_c - a)^2 + d - 1}} + a - a_c \]

**Theorem**

Let \( d \geq 2 \) and \( p < 2^* \). If either \( a \in [0, a_c) \) and \( b > 0 \), or \( a < 0 \) and \( b \geq b_{FS}(a) \), then the optimal functions for the Caffarelli-Kohn-Nirenberg inequalities are radially symmetric.
The Emden-Fowler transformation and the cylinder

With an Emden-Fowler transformation, Caffarelli-Kohn-Nirenberg inequalities on the Euclidean space are equivalent to Gagliardo-Nirenberg inequalities on a cylinder

\[ v(r, \omega) = r^{a-c} \varphi(s, \omega) \quad \text{with} \quad r = |x|, \quad s = -\log r \quad \text{and} \quad \omega = \frac{x}{r} \]

With this transformation, the Caffarelli-Kohn-Nirenberg inequalities can be rewritten as

\[ \| \partial_s \varphi \|^2_{L^2(C)} + \| \nabla \omega \varphi \|^2_{L^2(C)} + \Lambda \| \varphi \|^2_{L^2(C)} \geq \mu(\Lambda) \| \varphi \|^2_{L^p(C)} \quad \forall \varphi \in H^1(C) \]

where \( \Lambda := (a_c - a)^2 \), \( C = \mathbb{R} \times S^{d-1} \) and the optimal constant \( \mu(\Lambda) \) is

\[ \mu(\Lambda) = \frac{1}{C_{a,b}} \quad \text{with} \quad a = a_c \pm \sqrt{\Lambda} \quad \text{and} \quad b = \frac{d}{p} \pm \sqrt{\Lambda} \]
Generalized Caffarelli-Kohn-Nirenberg inequalities (CKN)

Let \( 2^* = \infty \) if \( d = 1 \) or \( d = 2 \), \( 2^* = 2d/(d-2) \) if \( d \geq 3 \) and define

\[
\vartheta(p, d) := \frac{d(p-2)}{2p}
\]

[Caffarelli-Kohn-Nirenberg-84] Let \( d \geq 1 \). For any \( \theta \in [\vartheta(p, d), 1] \), with \( p = \frac{2d}{d-2+2(b-a)} \), there exists a positive constant \( C_{\text{CKN}}(\theta, p, a) \) such that

\[
\left( \int_{\mathbb{R}^d} \frac{|u|^p}{|x|^{b_p}} \, dx \right)^{\frac{2}{p}} \leq C_{\text{CKN}}(\theta, p, a) \left( \int_{\mathbb{R}^d} \frac{|
abla u|^2}{|x|^{2a}} \, dx \right)^{\theta} \left( \int_{\mathbb{R}^d} \frac{|u|^2}{|x|^{2(a+1)}} \, dx \right)^{1-\theta}
\]

In the radial case, with \( \Lambda = (a - a_c)^2 \), the best constant when the inequality is restricted to radial functions is \( C^*_{\text{CKN}}(\theta, p, a) \) and

\[
C_{\text{CKN}}(\theta, p, a) \geq C^*_{\text{CKN}}(\theta, p, a) = C^*_{\text{CKN}}(\theta, p) \Lambda^{\frac{p-2}{2p} - \theta}
\]

\[
C^*_{\text{CKN}}(\theta, p) = \left[ \frac{2 \pi^{d/2}}{\Gamma(d/2)} \right]^{\frac{p-1}{p}} \left[ \frac{(p-2)^2}{2+(2 \theta-1)p} \right]^{\frac{p-2}{2p}} \left[ \frac{2+(2 \theta-1)p}{2 p \theta} \right]^{\theta} \left[ \frac{4}{p+2} \right]^{\frac{6-p}{2p}} \left[ \frac{\Gamma\left(\frac{2}{p-2} + \frac{1}{2}\right)}{\sqrt{\pi} \, \Gamma\left(\frac{2}{p-2}\right)} \right]^{\frac{p-2}{p}}
\]
Among functions \( w \in H^1(\mathcal{C}) \) which depend only on \( s \), the minimum of

\[
\mathcal{J}[w] := \int_{\mathcal{C}} \left( |\nabla w|^2 + \frac{1}{4} (d - 2 - 2a)^2 |w|^2 \right) \, dx - [C^*(\theta, p, a)]^{-\frac{1}{\theta}} \frac{\left( \int_{\mathcal{C}} |w|^p \, dx \right)^{\frac{2}{p \theta}}}{\left( \int_{\mathcal{C}} |w|^2 \, dx \right)^{\frac{1-\theta}{\theta}}}
\]

is achieved by \( \overline{w}(y) := \left[ \cosh(\lambda s) \right]^{-\frac{2}{p-2}}, \ y = (s, \omega) \in \mathbb{R} \times \mathbb{S} = \mathcal{C} \) with \( \lambda := \frac{1}{4} (d - 2 - 2a) (p - 2) \sqrt{\frac{p+2}{2p \theta - (p-2)}} \) as a solution of

\[
\lambda^2 (p - 2)^2 w'' - 4 w + 2p |w|^{p-2} w = 0
\]

Spectrum of \( \mathcal{L} := -\Delta + \kappa \overline{w}^{p-2} + \mu \) is given for \( \sqrt{1 + 4 \kappa / \lambda^2} \geq 2j + 1 \) by \( \lambda_{i,j} = \mu + i(d + i - 2) - \frac{\lambda^2}{4} \left( \sqrt{1 + 4 \kappa / \lambda^2} - (1 + 2j) \right)^2 \) \( \forall i, j \in \mathbb{N} \)

- The eigenspace of \( \mathcal{L} \) corresponding to \( \lambda_{0,0} \) is generated by \( \overline{w} \)
- The eigenfunction \( \phi_{(1,0)} \) associated to \( \lambda_{1,0} \) is not radially symmetric and such that \( \int_{\mathcal{C}} \overline{w} \phi_{(1,0)} \, dx = 0 \) and \( \int_{\mathcal{C}} \overline{w}^{p-1} \phi_{(1,0)} \, dx = 0 \)
- If \( \lambda_{1,0} < 0 \), optimal functions for (CKN) cannot be radially symmetric and \( C(\theta, p, a) > C^*(\theta, p, a) \)
A parametrization of the solutions

All optimal functions can be computed
▷ by solving (numerically)
\[-\Delta u + \mu u = u^{p-1}\]

▷ by computing $\Lambda = \Lambda^\theta(\mu)$ (reparametrization)
and the corresponding optimal constant is given by

\[J^\theta(\mu) := Q^\theta_{\Lambda^\theta(\mu)}[u_\mu]\]

where

\[Q^\theta_\Lambda[u] := \frac{\left(\|\nabla u\|^2_{L^2(C)} + \Lambda \|u\|^2_{L^2(C)}\right)^\theta \|u\|^2_{L^2(C)}^{1-\theta}}{\|u\|^2_{L^p(C)}}\]

If $u_\mu$ is symmetric, then

\[J^\theta(\mu) = J^\theta(1) \mu^\alpha\]
Parametric plot of $\mu \mapsto (\Lambda^{\theta}(\mu), J^{\theta}(\mu))$ for $p = 2.8$, $d = 5$, $\theta = 1$.
Parametric plot of $\mu \mapsto (\Lambda^{\theta}(\mu), J^{\theta}(\mu))$ for $p = 2.8$, $d = 5$, $\theta = 0.8$
Parametric plot of $\mu \mapsto (\Lambda^\theta(\mu), J^\theta(\mu))$ for $p = 2.8$, $d = 5$, $\theta = 0.72$
Enlargement for $p = 2.8$, $d = 5$, $\theta = 0.95$
Enlargement for $p = 2.8$, $d = 5$, $\theta = 0.72$
Critical case $\theta = \vartheta(p, d)$
Parametric plot of $\mu \mapsto (\Lambda^\theta(\mu), J^\theta(\mu))$ for $p = 3.15$, $d = 5$, $\theta = 1$
Parametric plot of $\mu \mapsto (\Lambda^\theta(\mu), J^\theta(\mu))$ for $p = 3.15, d = 5, \theta = 0.95$
Case $p = 3.15$, $d = 5$, $\theta = \vartheta(3.15, 5) \approx 0.9127$
Local and asymptotic criteria for $\theta = \vartheta(p, d) - \text{numerical}$

- **Local criterion:** based on an expansion of the solutions near the bifurcation point, it decides whether the branch goes to the right to the left.

- **Asymptotic criterion:** based on the energy of the branch as $\Lambda \to +\infty$ and an analysis in a semi-classical regime.
Fast diffusion equations, large time asymptotics, spectrum

- Weighted fast diffusion equations
  - The equation and the self-similar solutions
  - Without weights
  - A perturbation result
  - Symmetry breaking
  - More on symmetry

- Large time asymptotics

- Linearization and optimality

Most recent results: joint work with M. Bonforte, M. Muratori and B. Nazaret, and with M.J. Esteban and M. Loss
Fast diffusion equations with weights: self-similar solutions

Let us consider the fast diffusion equation with weights

$$u_t + |x|^{\gamma} \nabla \cdot (|x|^{-\beta} u \nabla u^{m-1}) = 0 \quad (t, x) \in \mathbb{R}^+ \times \mathbb{R}^d$$

Here $\beta$ and $\gamma$ are two real parameters, and $m \in [m_1, 1)$ with

$$m_1 := \frac{2d - 2\beta - \gamma}{2(d - \gamma)}$$

Generalized Barenblatt self-similar solutions

$$u_*(\rho t, x) = t^{-\rho (d - \gamma)} \mathcal{B}_{\beta, \gamma} (t^{-\rho} x), \quad \mathcal{B}_{\beta, \gamma}(x) = (1 + |x|^{2+\beta - \gamma})^{\frac{1}{m-1}}$$

where $1/\rho = (d - \gamma)(m - m_c)$ with $m_c := \frac{d - 2 - \beta}{d - \gamma} < m_1 < 1$

Self-similar solutions are known to govern the asymptotic behavior of the solutions when $(\beta, \gamma) = (0, 0)$
Mass conservation
\[
\frac{d}{dt} \int_{\mathbb{R}^d} u \frac{dx}{|x|^\gamma} = 0
\]
and self-similar solutions suggest to introduce the

Time-dependent rescaling
\[
u(t, x) = R^{\gamma-d} v \left( (2 + \beta - \gamma)^{-1} \log R, \frac{x}{R} \right)
\]
with \( R = R(t) \) defined by
\[
\frac{dR}{dt} = (2 + \beta - \gamma) R^{(m-1)(\gamma-d)-(2+\beta-\gamma)+1}, \quad R(0) = 1
\]
\[
R(t) = \left( 1 + \frac{2+\beta-\gamma}{\rho} t \right)^\rho
\]
with \( 1/\rho = (1-m)(\gamma-d) + 2 + \beta - \gamma = (d-\gamma)(m-m_c) \)

A Fokker-Planck type equation
\[
\nu_t + |x|^\gamma \nabla \cdot \left[ |x|^{-\beta} \nu \nabla \left( \nu^{m-1} - |x|^{2+\beta-\gamma} \right) \right] = 0
\]
with initial condition \( \nu(t = 0, \cdot) = u_0 \)
**Without weights: time-dependent rescaling, free energy**

- **Time-dependent rescaling:** Take $u(\tau, y) = R^{-d}(\tau) \nu(t, y/R(\tau))$

  where
  \[
  \frac{dR}{d\tau} = R^{d(1-m)-1}, \quad t = \frac{1}{2} \log R
  \]

- The function $\nu$ solves a Fokker-Planck type equation
  \[
  \frac{\partial \nu}{\partial t} = \frac{m-1}{m} \Delta \nu^m + \nabla \cdot (x \nu)
  \]

- [Ralston, Newman, 1984] Lyapunov functional:
  *Generalized entropy* or *Free energy*
  \[
  \mathcal{F}[\nu] := \int_{\mathbb{R}^d} \left( -\frac{\nu^m}{m} + |x|^2 \nu \right) \, dx - \mathcal{F}_0
  \]

  Entropy production is measured by the *Generalized Fisher information*
  \[
  \frac{d}{dt} \mathcal{F}[\nu] = -\mathcal{I}[\nu], \quad \mathcal{I}[\nu] := \int_{\mathbb{R}^d} \nu \left| \nabla \nu^{m-1} + 2 |x|^2 \right| \, dx
  \]
Without weights: relative entropy, entropy production

Stationary solution: choose $C$ such that $\|v_\infty\|_{L^1} = \|u\|_{L^1} = M > 0$

$$v_\infty(x) := (C + |x|^2)^{-1/(1-m)}$$

Relative entropy: Fix $F_0$ so that $F[v_\infty] = 0$

Entropy – entropy production inequality

Theorem

$d \geq 3$, $m \in \left[\frac{d-1}{d}, +\infty\right)$, $m > \frac{1}{2}$, $m \neq 1$

$$\mathcal{I}[\nu] \geq 4 \mathcal{F}[\nu]$$

Corollary

A solution $\nu$ with initial data $u_0 \in L^1_+ (\mathbb{R}^d)$ such that $|x|^2 u_0 \in L^1(\mathbb{R}^d)$, $u_0^m \in L^1(\mathbb{R}^d)$ satisfies

$$\mathcal{F}[\nu(t, \cdot)] \leq \mathcal{F}[u_0] e^{-4t}$$
More simple facts...

- The entropy – entropy production inequality is equivalent to the Gagliardo-Nirenberg inequality
  
  \[ \| w \|_{L^{2p}(\mathbb{R}^d)} \leq C_{p,d}^{GN} \| \nabla w \|_{L^2(\mathbb{R}^d)}^\theta \| w \|_{L^{p+1}(\mathbb{R}^d)}^{1-\theta} \]

  Proofs: variational methods [del Pino, J.D.], or carré du champ method (Bakry-Emery): [Carrillo, Toscani], [Carrillo, Vázquez], [CJMTU]

- Sharp asymptotic rates are determined by the spectral gap in the linearized entropy – entropy production (Hardy–Poincaré) inequality
  
  [Blanchet, Bonforte, J.D., Grillo, Vázquez]

- Higher order matching asymptotics can be achieved by best matching methods: [Bonforte, J.D., Grillo, Vázquez], [J.D., Toscani]
Improved entropy – entropy production inequalities \( \varphi(\mathcal{F}[\nu]) \leq \mathcal{I}[\nu] \) can be proved [J.D., Toscani], [Carrillo, Toscani]

Rényi entropy powers: concavity, asymptotic regime (self-similar solutions) and Gagliardo-Nirenberg inequalities in scale invariant form [Savaré, Toscani], [J.D., Toscani]

Concavity of second moment estimates and delays [J.D., Toscani]

Stability of entropy – entropy production inequalities (scaling methods), and improved rates of convergence [Carrillo, Toscani], [J.D., Toscani]
Spectrum of the linearized operator

\[ \text{Essential spectrum of } (1 - m) \mathcal{L}_{1/(m-1),d} \]

\[ m_c = \frac{d-2}{d} \]

\[ \tilde{m}_1 = \frac{d}{d+2} \]

\[ m_1 = \frac{d-1}{d} \]

\[ m_2 = \frac{d+1}{d+2} \]

\[ \tilde{m}_2 : = \frac{d+4}{d+6} \]

\[ m_c = \frac{d-2}{d} \]

Case 1

Case 2

Case 3

\[ \gamma(m) \]

J. Dolbeault

Optimal constants and spectral gaps
With one weight: a perturbation result

On the space of smooth functions on $\mathbb{R}^d$ with compact support

$$\|w\|_{L^{2p, \gamma} (\mathbb{R}^d)} \leq C_\gamma \|\nabla w\|_{L^2(\mathbb{R}^d)}^{\vartheta} \|w\|_{L^{p+1, \gamma} (\mathbb{R}^d)}^{1-\vartheta}$$

where $\vartheta := \frac{2^* (p-1)}{2p(2^*-p-1)} = \frac{(d-\gamma)(p-1)}{p \left(d+2-2\gamma-p(d-2)\right)}$ and

$$\|w\|_{L^q, \gamma (\mathbb{R}^d)} := \left(\int_{\mathbb{R}^d} |w|^q |x|^{-\gamma} \, dx\right)^{1/q} \quad \text{and} \quad \|w\|_{L^q(\mathbb{R}^d)} := \|w\|_{L^{q,0} (\mathbb{R}^d)}$$

and $d \geq 3$, $\gamma \in (0, 2)$, $p \in (1, 2^*/2)$ with $2^* := 2 \frac{d-\gamma}{d-2}$

**Theorem**

[J.D., Muratorio, Nazaret] Let $d \geq 3$. For any $p \in (1, d/(d-2))$, there exists a positive $\gamma^*$ such that equality holds for all $\gamma \in (0, \gamma^*)$ with

$$w_\gamma(x) := (1 + |x|^{2-\gamma})^{-\frac{1}{p-1}} \quad \forall x \in \mathbb{R}^d$$
Caffarelli-Kohn-Nirenberg inequalities (with two weights)

Norms: $\|w\|_{L^{q,\gamma}(\mathbb{R}^d)} := (\int_{\mathbb{R}^d} |w|^q |x|^{-\gamma} \, dx)^{1/q}$, $\|w\|_{L^q(\mathbb{R}^d)} := \|w\|_{L^{q,0}(\mathbb{R}^d)}$

$$\|w\|_{L^{2p,\gamma}(\mathbb{R}^d)} \leq C_{\beta,\gamma,p} \|\nabla w\|_{L^{2,\beta}(\mathbb{R}^d)}^{\vartheta} \|w\|_{L^{p+1,\gamma}(\mathbb{R}^d)}^{1-\vartheta} \quad (\text{CKN})$$

Here $C_{\beta,\gamma,p}$ denotes the optimal constant, the parameters satisfy

$$d \geq 2, \quad \gamma-2 < \beta < \frac{d-2}{d} \gamma, \quad \gamma \in (-\infty, d), \quad p \in (1, p_\ast] \quad \text{with} \quad p_\ast := \frac{d-\gamma}{d-\beta-2}$$

and the exponent $\vartheta$ is determined by the scaling invariance, i.e.,

$$\vartheta = \frac{(d-\gamma)(p-1)}{p \left(d+\beta+2-2\gamma-p(d-\beta-2)\right)}$$

Is the equality case achieved by the Barenblatt / Aubin-Talenti type function

$$w_\ast(x) = (1 + |x|^{2+\beta-\gamma})^{-1/(p-1)} \quad \forall x \in \mathbb{R}^d$$

Do we know (symmetry) that the equality case is achieved among radial functions?

J. Dolbeault
Range of the parameters

\[ \beta = \frac{d-2}{d} \gamma \]

\[ \beta = d - 2 + \frac{\gamma - d}{p} \]
When symmetry holds, (CKN) can be written as an entropy – entropy production inequality

\[ \frac{1-m}{m} (2 + \beta - \gamma)^2 \mathcal{F}[v] \leq \mathcal{I}[v] \]

and equality is achieved by \( \mathfrak{B}_{\beta,\gamma} \). Here the free energy and the relative Fisher information are defined by

\[ \mathcal{F}[v] := \frac{1}{m - 1} \int_{\mathbb{R}^d} \left( v^m - \mathfrak{B}_{\beta,\gamma}^m - m \mathfrak{B}_{\beta,\gamma}^{m-1} (v - \mathfrak{B}_{\beta,\gamma}) \right) \frac{dx}{|x|^{\gamma}} \]

\[ \mathcal{I}[v] := \int_{\mathbb{R}^d} v \left| \nabla v^{m-1} - \nabla \mathfrak{B}_{\beta,\gamma}^{m-1} \right|^2 \frac{dx}{|x|^\beta}. \]

If \( v \) solves the Fokker-Planck type equation

\[ v_t + |x|^{\gamma} \nabla \cdot \left( |x|^{-\beta} v \nabla (v^{m-1} - |x|^{2+\beta-\gamma}) \right) = 0 \quad (WFDE-FP) \]

then

\[ \frac{d}{dt} \mathcal{F}[v(t, \cdot)] = - \frac{m}{1 - m} \mathcal{I}[v(t, \cdot)] \]
Proposition

Let \( m = \frac{p+1}{2p} \) and consider a solution to (WFDE-FP) with nonnegative initial datum \( u_0 \in L^{1,\gamma}(\mathbb{R}^d) \) such that \( \|u_0^m\|_{L^{1,\gamma}(\mathbb{R}^d)} \) and \( \int_{\mathbb{R}^d} u_0 |x|^{2+\beta-2\gamma} \, dx \) are finite. Then

\[
\mathcal{F}[v(t, \cdot)] \leq \mathcal{F}[u_0] \, e^{-(2+\beta-\gamma)^2 t} \quad \forall \, t \geq 0
\]

if one of the following two conditions is satisfied:
(i) either \( u_0 \) is a.e. radially symmetric
(ii) or symmetry holds in (CKN)
Let us define
\[
\beta_{FS}(\gamma) := d - 2 - \sqrt{(d - \gamma)^2 - 4(d - 1)}
\]

**Theorem**

*Symmetry breaking holds in (CKN) if*

\[
\gamma < 0 \text{ and } \beta_{FS}(\gamma) < \beta < \frac{d - 2}{d} \gamma
\]

In the range \(\beta_{FS}(\gamma) < \beta < \frac{d-2}{d} \gamma\), \(w_\star(x) = (1 + |x|^2 + \beta - \gamma)^{-1/(p-1)}\) is not optimal.
The grey area corresponds to the admissible cone. The light grey area is the region of symmetry, while the dark grey area is the region of symmetry breaking. The threshold is determined by the hyperbola

$$(d - \gamma)^2 - (\beta - d + 2)^2 - 4(d - 1) = 0$$
A useful change of variables

With
\[ \alpha = 1 + \frac{\beta - \gamma}{2} \quad \text{and} \quad n = 2 \frac{d - \gamma}{\beta + 2 - \gamma}, \]

(CKN) can be rewritten for a function \( v(|x|^{\alpha-1}x) = w(x) \) as
\[ \|v\|_{L^{2p,d-n}(\mathbb{R}^d)} \leq K_{\alpha,n,p} \|\mathcal{D}_\alpha v\|_{L^{2,d-n}(\mathbb{R}^d)}^{\mathcal{D}_\alpha} \|v\|_{L^{p+1,d-n}(\mathbb{R}^d)}^{1-\mathcal{D}_\alpha} \]

with the notations \( s = |x|, \mathcal{D}_\alpha v = (\alpha \frac{\partial v}{\partial s}, \frac{1}{s} \nabla \omega v) \). Parameters are in the range
\[ d \geq 2, \quad \alpha > 0, \quad n > d \quad \text{and} \quad p \in (1, p_*], \quad p_* := \frac{n}{n-2} \]

By our change of variables, \( w_* \) is changed into
\[ v_*(x) := (1 + |x|^2)^{-1/(p-1)} \quad \forall x \in \mathbb{R}^d \]

The symmetry breaking condition (Felli-Schneider) now reads
\[ \alpha > \alpha_{FS} \quad \text{with} \quad \alpha_{FS} := \sqrt{\frac{d-1}{n-1}} \]
The second variation

\[ \mathcal{J}[\nu] := \nu \log ( \| \mathcal{D}_\alpha \nu \|_{L^2,d-n(\mathbb{R}^d)}) + (1 - \nu) \log ( \| \nu \|_{L^{p+1},d-n(\mathbb{R}^d)}) + \log K_{\alpha,n,p} - \log ( \| \nu \|_{L^{2p},d-n(\mathbb{R}^d)}) \]

Let us define \( d\mu_\delta := \mu_\delta(x) \, dx \), where \( \mu_\delta(x) := (1 + |x|^2)^{-\delta} \). Since \( \nu_* \) is a critical point of \( \mathcal{J} \), a Taylor expansion at order \( \varepsilon^2 \) shows that

\[ \| \mathcal{D}_\alpha \nu_* \|_{L^2,d-n(\mathbb{R}^d)^2} \mathcal{J}[\nu_* + \varepsilon \mu_\delta/2 \, f] = \frac{1}{2} \varepsilon^2 \nu \, Q[f] + o(\varepsilon^2) \]

with \( \delta = \frac{2p}{p-1} \) and

\[ Q[f] = \int_{\mathbb{R}^d} |\mathcal{D}_\alpha f|^2 |x|^{n-d} \, d\mu_\delta - \frac{4 \, p \, \alpha^2}{p-1} \int_{\mathbb{R}^d} |f|^2 |x|^{n-d} \, d\mu_{\delta+1} \]

We assume that \( \int_{\mathbb{R}^d} f |x|^{n-d} \, d\mu_{\delta+1} = 0 \) (mass conservation)
Symmetry breaking: the proof

Proposition (Hardy-Poincaré inequality)

Let $d \geq 2, \alpha \in (0, +\infty), n > d$ and $\delta \geq n$. If $f$ has 0 average, then

$$\int_{\mathbb{R}^d} \left| \mathcal{D}_\alpha f \right|^2 |x|^{n-d} d\mu_\delta \geq \Lambda \int_{\mathbb{R}^d} |f|^2 |x|^{n-d} d\mu_{\delta + 1}$$

with optimal constant $\Lambda = \min \{ 2 \alpha^2 (2 \delta - n), 2 \alpha^2 \delta \eta \}$ where $\eta$ is the unique positive solution to $\eta (\eta + n - 2) = (d - 1)/\alpha^2$. The corresponding eigenfunction is not radially symmetric if $\alpha^2 > \frac{(d-1)\delta^2}{n(2\delta-n)(\delta-1)}$.

$Q \geq 0$ iff $\frac{4p\alpha^2}{p-1} \leq \Lambda$ and symmetry breaking occurs in (CKN) if

$$2 \alpha^2 \delta \eta < \frac{4p\alpha^2}{p-1} \iff \eta < 1$$

$$\iff \frac{d-1}{\alpha^2} = \eta (\eta + n - 2) < n - 1 \iff \alpha > \alpha_{FS}$$
Fast diffusion equations with weights: a symmetry result

- Rényi entropy powers
- The symmetry result
- The strategy of the proof

Joint work with M.J. Esteban, M. Loss in the critical case

$$\beta = d - 2 + \frac{\gamma - d}{p}$$

Joint work with M.J. Esteban, M. Loss and M. Muratori in the subcritical case

$$d - 2 + \frac{\gamma - d}{p} < \beta < \frac{d - 2}{d} \gamma$$
Rényi entropy powers

[Savaré, Toscani] We consider the flow \( \frac{\partial u}{\partial t} = \Delta u^m \) and the Gagliardo-Nirenberg inequalities (GN)

\[
\| w \|_{L^{2p}(\mathbb{R}^d)} \leq C_{p,d}^{GN} \| \nabla w \|_{L^2(\mathbb{R}^d)}^{\theta} \| w \|_{L^{p+1}(\mathbb{R}^d)}^{1-\theta}
\]

where \( u = w^{2p} \), that is, \( w = u^{m-1/2} \) with \( p = \frac{1}{2} \frac{m-1}{m} \). Straightforward computations show that (GN) can be brought into the form

\[
\left( \int_{\mathbb{R}^d} u \, dx \right)^{(\sigma+1) m-1} \leq C \mathcal{I} \mathcal{E}^{\sigma-1} \quad \text{where} \quad \sigma = \frac{2}{d (1-m)} - 1
\]

where \( \mathcal{E} := \int_{\mathbb{R}^d} u^m \, dx \) and \( \mathcal{I} := \int_{\mathbb{R}^d} u |\nabla P|^2 \, dx \), \( P = \frac{m}{1-m} u^{m-1} \) is the pressure variable. If \( \mathcal{F} = \mathcal{E}^\sigma \) is the Rényi entropy power and \( \sigma = \frac{2}{d} \frac{1}{1-m} - 1 \), then \( \mathcal{F}'' \) is proportional to

\[
-2(1-m) \left\langle \text{Tr} \left( (\text{Hess } P - \frac{1}{d} \Delta P \text{ Id})^2 \right) \right\rangle + (1-m)^2 (1-\sigma) \left\langle (\Delta P - \langle \Delta P \rangle)^2 \right\rangle
\]

where we have used the notation \( \langle A \rangle := \int_{\mathbb{R}^d} u^m A \, dx / \int_{\mathbb{R}^d} u^m \, dx \).
The symmetry result

▷ critical case: [J.D., Esteban, Loss; Inventiones]
▷ subcritical case: [J.D., Esteban, Loss, Muratori; CR Math.]

Theorem

Assume that $\beta \leq \beta_{FS}(\gamma)$. Then all positive solutions in $H_{\beta,\gamma}^p(\mathbb{R}^d)$ of

$$
- \text{div} \left( |x|^{-\beta} \nabla w \right) = |x|^{-\gamma} \left( w^{2p-1} - w^p \right) \quad \text{in} \quad \mathbb{R}^d \setminus \{0\}
$$

are radially symmetric and, up to a scaling and a multiplication by a constant, equal to $w_*(x) = (1 + |x|^{2+\beta-\gamma})^{-1/(p-1)}$
The strategy of the proof (1/3)

The first step is based on a change of variables which amounts to rephrase our problem in a space of higher, artificial dimension $n > d$ (here $n$ is a dimension at least from the point of view of the scaling properties), or to be precise to consider a weight $|x|^{n-d}$ which is the same in all norms. With

$$v(|x|^{\alpha-1} x) = w(x), \quad \alpha = 1 + \frac{\beta - \gamma}{2} \quad \text{and} \quad n = 2 \frac{d - \gamma}{\beta + 2 - \gamma}$$

we claim that Inequality (CKN) can be rewritten for a function $v(|x|^{\alpha-1} x) = w(x)$ as

$$\|v\|_{L_p, d-n(R^d)} \leq K_{\alpha, n, p} \|\mathcal{D}_\alpha v\|_{L^2, d-n(R^d)} \|v\|_{L^{p+1, d-n}(R^d)}^{1-\frac{\gamma}{p}} \quad \forall v \in H^p_{d-n, d-n}(R^d)$$

with the notations $s = |x|$, $\mathcal{D}_\alpha v = (\alpha \frac{\partial v}{\partial s}, \frac{1}{s} \nabla_\omega v)$ and

$$d \geq 2, \quad \alpha > 0, \quad n > d \quad \text{and} \quad p \in (1, p_*] .$$

By our change of variables, $w_*$ is changed into

$$v_*(x) := (1 + |x|^2)^{-1/(p-1)} \quad \forall x \in \mathbb{R}^d$$
The strategy of the proof (2/3): concavity of the Rényi entropy power

The derivative of the generalized Rényi entropy power functional is

$$ G[u] := \left( \int_{\mathbb{R}^d} u^m \, d\mu \right)^{\sigma^{-1}} \int_{\mathbb{R}^d} u \, |\nabla P|^2 \, d\mu $$

where $\sigma = \frac{2}{d} \frac{1}{1-m} - 1$. Here $d\mu = |x|^{n-d} \, dx$ and the pressure is

$$ P := \frac{m}{1-m} u^{m-1} $$

Proving the symmetry in the inequality amounts to proving the monotonicity of $G[u]$ along a well chosen fast diffusion flow.
With $\mathcal{L}_\alpha = -\mathcal{D}_\alpha^* \mathcal{D}_\alpha = \alpha^2 \left( u'' + \frac{n-1}{s} u' \right) + \frac{1}{s^2} \Delta_\omega u$, we consider the fast diffusion equation

$$\frac{\partial u}{\partial t} = \mathcal{L}_\alpha u^m$$

in the subcritical range $1 - 1/n < m < 1$. The key computation is the proof that

$$- \frac{d}{dt} G[u(t, \cdot)] \left( \int_{\mathbb{R}^d} u^m \, d\mu \right)^{1-\sigma} \geq (1 - m) (\sigma - 1) \int_{\mathbb{R}^d} u^m \left| \mathcal{L}_\alpha P - \frac{\int_{\mathbb{R}^d} u |\mathcal{D}_\alpha P|^2 \, d\mu}{\int_{\mathbb{R}^d} u^m \, d\mu} \right|^2 \, d\mu$$

$$+ 2 \int_{\mathbb{R}^d} \left( \alpha^4 \left( 1 - \frac{1}{n} \right) \left| P'' - \frac{P'}{s} - \frac{\Delta_\omega P}{\alpha^2 (n-1) s^2} \right|^2 + \frac{2 \alpha^2}{s^2} \left| \nabla_\omega P' - \frac{\nabla_\omega P}{s} \right|^2 \right) u^m \, d\mu$$

$$+ 2 \int_{\mathbb{R}^d} \left( (n - 2) \left( \alpha_{FS}^2 - \alpha^2 \right) |\nabla_\omega P|^2 + c(n, m, d) \frac{|\nabla_\omega P|^4}{P^2} \right) u^m \, d\mu =: \mathcal{H}[u]$$

for some numerical constant $c(n, m, d) > 0$. Hence if $\alpha \leq \alpha_{FS}$, the r.h.s. $\mathcal{H}[u]$ vanishes if and only if $P$ is an affine function of $|x|^2$, which proves the symmetry result.
The strategy of the proof (3/3): integrations by parts

This method has a hidden difficulty: integrations by parts! Hints:

- use **elliptic regularity**: Moser iteration scheme, Sobolev regularity, local Hölder regularity, Harnack inequality, and get global regularity using scalings... to deduce decay estimates

- use the Emden-Fowler transformation, work on a cylinder, truncate, evaluate boundary terms of high order derivatives using Poincaré inequalities on the sphere
Fast diffusion equations with weights: large time asymptotics

- Relative uniform convergence
- Asymptotic rates of convergence
- From asymptotic to global estimates

Here \( \nu \) solves the \textit{Fokker-Planck type equation}

\[
\nu_t + |x|^\gamma \nabla \cdot \left[ |x|^{-\beta} \nu \nabla \left( \nu^{m-1} - |x|^{2+\beta-\gamma} \right) \right] = 0 \quad \text{(WFDE-FP)}
\]

Joint work with M. Bonforte, M. Muratori and B. Nazaret
Relative uniform convergence

\[ \zeta := 1 - \left(1 - \frac{2-m}{(1-m)q}\right) \left(1 - \frac{2-m}{1-m} \theta\right) \]
\[ \theta := \frac{(1-m)(2+\beta-\gamma)}{(1-m)(2+\beta)+2+\beta-\gamma} \text{ is in the range } 0 < \theta < \frac{1-m}{2-m} < 1 \]

Theorem

For “good” initial data, there exist positive constants \( K \) and \( t_0 \) such that, for all \( q \in \left[\frac{2-m}{1-m}, \infty\right) \), the function \( w = v/\mathcal{B} \) satisfies

\[ \|w(t) - 1\|_{L^q, \gamma(\mathbb{R}^d)} \leq K e^{-2 \frac{(1-m)^2}{2-m} \Lambda \zeta(t-t_0)} \quad \forall \ t \geq t_0 \]

in the case \( \gamma \in (0, d) \), and

\[ \|w(t) - 1\|_{L^q, \gamma(\mathbb{R}^d)} \leq K e^{-2 \frac{(1-m)^2}{2-m} \Lambda(t-t_0)} \quad \forall \ t \geq t_0 \]

in the case \( \gamma \leq 0 \)
The spectrum of $\mathcal{L}$ as a function of $\delta = \frac{1}{1-m}$, with $n = 5$. The essential spectrum corresponds to the grey area, and its bottom is determined by the parabola $\delta \mapsto \Lambda_{\text{ess}}(\delta)$. The two eigenvalues $\Lambda_{0,1}$ and $\Lambda_{1,0}$ are given by the plain, half-lines, away from the essential spectrum. The spectral gap determines the asymptotic rate of convergence to the Barenblatt functions
Main steps of the proof:

- Existence of weak solutions, \( L^{1,\gamma} \) contraction, Comparison Principle, conservation of relative mass
- Self-similar variables and the Ornstein-Uhlenbeck equation in relative variables: the ratio \( w(t, x) := v(t, x)/\mathcal{B}(x) \) solves

\[
\begin{cases}
|x|^{-\gamma} w_t = -\frac{1}{\mathcal{B}} \nabla \cdot \left( |x|^{-\beta} \mathcal{B} w \nabla \left( (w^{m-1} - 1) \mathcal{B}^{m-1} \right) \right) & \text{in } \mathbb{R}^+ \times \mathbb{R}^d \\
w(0, \cdot) = w_0 := v_0/\mathcal{B} & \text{in } \mathbb{R}^d
\end{cases}
\]

- \textit{Regularity}, relative uniform convergence (without rates) and asymptotic rates (linearization)
- The relative free energy and the relative Fisher information: linearized free energy and linearized Fisher information
- A Duhamel formula and a bootstrap
Regularity (1/2): Harnack inequality and Hölder regularity

We change variables: $x \mapsto |x|^\alpha - 1 \cdot x$ and adapt the ideas of F. Chiarenza and R. Serapioni to

$$u_t + D^*_\alpha \left[ a (D_\alpha u + B u) \right] = 0 \quad \text{in} \quad \mathbb{R}^+ \times \mathbb{R}^d$$

Proposition (A parabolic Harnack inequality)

Let $d \geq 2$, $\alpha > 0$ and $n > d$. If $u$ is a bounded positive solution, then for all $(t_0, x_0) \in \mathbb{R}^+ \times \mathbb{R}^d$ and $r > 0$ such that $Q_r(t_0, x_0) \subset \mathbb{R}^+ \times B_1$, we have

$$\sup_{Q_r^-(t_0, x_0)} u \leq H \inf_{Q_r^+(t_0, x_0)} u$$

The constant $H > 1$ depends only on the local bounds on the coefficients $a, B$ and on $d, \alpha, and n$

By adapting the classical method à la De Giorgi to our weighted framework: Hölder regularity at the origin
Regularity (1/2): from local to global estimates

Lemma

If \( w \) is a solution of the the Ornstein-Uhlenbeck equation with initial datum \( w_0 \) bounded from above and from below by a Barenblatt profile (+ relative mass condition) = “good solutions”, then there exist \( \nu \in (0, 1) \) and a positive constant \( K > 0 \), depending on \( d, m, \beta, \gamma, C, C_1, C_2 \) such that:

\[
\| \nabla v(t) \|_{L^\infty(B_{2\lambda} \setminus B_\lambda)} \leq \frac{Q_1}{\lambda \frac{2+\beta-\gamma}{1-m} + 1} \quad \forall t \geq 1, \quad \forall \lambda > 1,
\]

\[
\sup_{t \geq 1} \| w \|_{C^k((t, t+1) \times B_{\varepsilon})} < \infty \quad \forall k \in \mathbb{N}, \quad \forall \varepsilon > 0
\]

\[
\sup_{t \geq 1} \| w(t) \|_{C^\nu(\mathbb{R}^d)} < \infty
\]

\[
\sup_{\tau \geq t} |w(\tau) - 1|_{C^\nu(\mathbb{R}^d)} \leq K \sup_{\tau \geq t} \| w(\tau) - 1 \|_{L^\infty(\mathbb{R}^d)} \quad \forall t \geq 1
\]
Corollary

Assume that $m \in (0,1)$, with $m \neq m_* \quad \text{with} \quad m_* := m \star$. Under the relative mass condition, for any “good solution” $v$ there exists a positive constant $C$ such that

$$\mathcal{F}[v(t)] \leq C e^{-2(1-m)\Lambda t} \quad \forall \ t \geq 0.$$ 

- With Csiszár-Kullback-Pinsker inequalities, these estimates provide a rate of convergence in $L^{1,\gamma}(\mathbb{R}^d)$
- Improved estimates can be obtained using “best matching techniques”
From asymptotic to global estimates

When symmetry holds (CKN) can be written as an entropy – entropy production inequality

\[(2 + \beta - \gamma)^2 \mathcal{F}[v] \leq \frac{m}{1 - m} \mathcal{I}[v]\]

so that

\[\mathcal{F}[v(t)] \leq \mathcal{F}[v(0)] e^{-2(1-m)\Lambda^* t} \quad \forall \ t \geq 0 \quad \text{with} \quad \Lambda^* := \frac{(2+\beta-\gamma)^2}{2(1-m)}\]

Let us consider again the entropy – entropy production inequality

\[\mathcal{K}(M) \mathcal{F}[v] \leq \mathcal{I}[v] \quad \forall \ v \in L^{1,\gamma}(\mathbb{R}^d) \quad \text{such that} \quad \|v\|_{L^{1,\gamma}(\mathbb{R}^d)} = M,\]

where \(\mathcal{K}(M)\) is the best constant: with \(\Lambda(M) := \frac{m}{2} (1 - m)^{-2} \mathcal{K}(M)\)

\[\mathcal{F}[v(t)] \leq \mathcal{F}[v(0)] e^{-2(1-m)\Lambda(M) t} \quad \forall \ t \geq 0\]
Proposition

- In the symmetry breaking range of (CKN), for any $M > 0$, we have
  \[ 0 < K(M) \leq \frac{2}{m} (1 - m)^2 \Lambda_{0,1} \]

- If symmetry holds in (CKN) then
  \[ K(M) \geq \frac{1-m}{m} (2 + \beta - \gamma)^2 \]

Corollary

Assume that $m \in [m_1, 1)$

(i) For any $M > 0$, if $\Lambda(M) = \Lambda_*$ then $\beta = \beta_{FS}(\gamma)$

(ii) If $\beta > \beta_{FS}(\gamma)$ then $\Lambda_{0,1} < \Lambda_*$ and $\Lambda(M) \in (0, \Lambda_{0,1}]$ for any $M > 0$

(iii) For any $M > 0$, if $\beta < \beta_{FS}(\gamma)$ and if symmetry holds in (CKN), then $\Lambda(M) > \Lambda_*$
Linearization and optimality

Joint work with M.J. Esteban and M. Loss
Linearization and scalar products

With $u_\varepsilon$ such that

$$u_\varepsilon = B_\ast \left( 1 + \varepsilon \right) \frac{B_\ast^{1-m}}{B_\ast^{1-m}} \quad \text{and} \quad \int_{\mathbb{R}^d} u_\varepsilon \, dx = M_\ast$$

at first order in $\varepsilon \to 0$ we obtain that $f$ solves

$$\frac{\partial f}{\partial t} = \mathcal{L} f \quad \text{where} \quad \mathcal{L} f := (1 - m) B_\ast^{m-2} |x|^{\gamma} D_\ast \left( |x|^{-\beta} B_\ast D_\alpha f \right)$$

Using the scalar products

$$\langle f_1, f_2 \rangle = \int_{\mathbb{R}^d} f_1 f_2 B_\ast^{2-m} |x|^{-\gamma} \, dx \quad \text{and} \quad \langle \langle f_1, f_2 \rangle \rangle = \int_{\mathbb{R}^d} D_\alpha f_1 \cdot D_\alpha f_2 B_\ast |x|^{-\beta} \, dx$$

we compute

$$\frac{1}{2} \frac{d}{dt} \langle f, f \rangle = \langle f, \mathcal{L} f \rangle = \int_{\mathbb{R}^d} f (\mathcal{L} f) B_\ast^{2-m} |x|^{-\gamma} \, dx = - \int_{\mathbb{R}^d} |D_\alpha f|^2 B_\ast |x|^{-\beta} \, dx$$

for any $f$ smooth enough, and

$$\frac{1}{2} \frac{d}{dt} \langle \langle f, f \rangle \rangle = \int_{\mathbb{R}^d} D_\alpha f \cdot D_\alpha (\mathcal{L} f) u |x|^{-\beta} \, dx = - \langle \langle f, \mathcal{L} f \rangle \rangle$$
Linearization of the flow, eigenvalues and spectral gap

Now let us consider an eigenfunction associated with the smallest positive eigenvalue $\lambda_1$ of $\mathcal{L}$

$$-\mathcal{L} f_1 = \lambda_1 f_1$$

so that $f_1$ realizes the equality case in the Hardy-Poincaré inequality

$$\langle g, g \rangle = -\langle f, \mathcal{L} f \rangle \geq \lambda_1 \| g - \bar{g} \|^2, \quad \bar{g} := \langle g, 1 \rangle / \langle 1, 1 \rangle$$

$$-\langle g, \mathcal{L} g \rangle \geq \lambda_1 \langle g, g \rangle$$

Proof: expansion of the square:

$$-\left\langle (g - \bar{g}), \mathcal{L} (g - \bar{g}) \right\rangle = \langle \mathcal{L} (g - \bar{g}), \mathcal{L} (g - \bar{g}) \rangle = \| \mathcal{L} (g - \bar{g}) \|^2$$

Key observation:

$$\lambda_1 \geq 4 \iff \alpha \leq \alpha_{FS} := \sqrt{\frac{d-1}{n-1}}$$
Symmetry breaking in CKN inequalities

Symmetry holds in (CKN) if $\mathcal{J}[w] \geq \mathcal{J}[w_\star]$ with

$$\mathcal{J}[w] := \vartheta \log (\|D_\alpha w\|_{L^2,\delta(R^d)}) + (1-\vartheta) \log (\|w\|_{L^{p+1,\delta(R^d)}}) - \log (\|w\|_{L^{2p,\delta(R^d)}})$$

with $\delta := d - n$ and

$$\mathcal{J}[w_\star + \varepsilon g] = \varepsilon^2 Q[g] + o(\varepsilon^2)$$

where

$$\frac{2}{\vartheta} \|D_\alpha w_\star\|^2_{L^2,d-n(R^d)} Q[g]$$

$$= \|D_\alpha g\|^2_{L^2,d-n(R^d)} + \frac{p(2+\beta-\gamma)}{(p-1)^2} \left[ d - \gamma - p(d - 2 - \beta) \right] \int_{R^d} |g|^2 \frac{|x|^{n-d}}{1+|x|^2} \, dx$$

$$- p(2p - 1) \frac{(2+\beta-\gamma)^2}{(p-1)^2} \int_{R^d} |g|^2 \frac{|x|^{n-d}}{(1+|x|^2)^2} \, dx$$

is a nonnegative quadratic form if and only if $\alpha \leq \alpha_{FS}$

Symmetry breaking holds if $\alpha > \alpha_{FS}$

J. Dolbeault
Information – production of information inequality

Let $\mathcal{K}[u]$ be such that

$$
\frac{d}{d\tau} \mathcal{I}[u(\tau, \cdot)] = -\mathcal{K}[u(\tau, \cdot)] = - \text{(sum of squares)}
$$

If $\alpha \leq \alpha_{FS}$, then $\lambda_1 \geq 4$ and

$$
\mathcal{K}[u] \mapsto \frac{\mathcal{K}[u]}{\mathcal{I}[u]} - 4
$$

is a nonnegative functional whose minimizer is achieved by $u = \mathcal{B}_\star$. With $u_\varepsilon = \mathcal{B}_\star \left(1 + \varepsilon \mathcal{B}_\star^{1-m}\right)$, we observe that

$$
4 \leq \mathcal{C}_2 := \inf_u \frac{\mathcal{K}[u]}{\mathcal{I}[u]} \leq \lim_{\varepsilon \to 0} \inf_f \frac{\mathcal{K}[u_\varepsilon]}{\mathcal{I}[u_\varepsilon]} = \inf_f \frac{\langle f, \mathcal{L} f \rangle}{\langle f, f \rangle} = \frac{\langle f_1, \mathcal{L} f_1 \rangle}{\langle f_1, f_1 \rangle} = \lambda_1
$$

if $\lambda_1 = 4$, that is, if $\alpha = \alpha_{FS}$, then $\inf \mathcal{K}/\mathcal{I} = 4$ is achieved in the asymptotic regime as $u \to \mathcal{B}_\star$ and determined by the spectral gap of $\mathcal{L}$.

if $\lambda_1 > 4$, that is, if $\alpha < \alpha_{FS}$, then $\mathcal{K}/\mathcal{I} > 4$.
If $\alpha \leq \alpha_{FS}$, the fact that $K/I \geq 4$ has an important consequence. Indeed we know that

$$\frac{d}{d\tau} (I[u(\tau, \cdot)] - 4 F[u(\tau, \cdot)]) \leq 0$$

so that

$$I[u] - 4 F[u] \geq I[B_\star] - 4 F[B_\star] = 0$$

This inequality is equivalent to $J[w] \geq J[w_\star]$, which establishes that optimality in (CKN) is achieved among symmetric functions. In other words, the linearized problem shows that for $\alpha \leq \alpha_{FS}$, the function

$$\tau \mapsto I[u(\tau, \cdot)] - 4 F[u(\tau, \cdot)]$$

is monotone decreasing.

This explains why the method based on nonlinear flows provides the optimal range for symmetry.
**Entropy – production of entropy inequality**

Using $\frac{d}{d\tau} (I[u(\tau, \cdot)] - C_2 \mathcal{F}[u(\tau, \cdot)]) \leq 0$, we know that

$$I[u] - C_2 \mathcal{F}[u] \geq I[B_\star] - C_2 \mathcal{F}[B_\star] = 0$$

As a consequence, we have that

$$C_1 := \inf_u \frac{I[u]}{\mathcal{F}[u]} \geq C_2 = \inf_u \frac{\mathcal{K}[u]}{I[u]}$$

With $u_\varepsilon = B_\star \left(1 + \varepsilon f B_\star^{1-m}\right)$, we observe that

$$C_1 \leq \liminf_{\varepsilon \to 0} \frac{I[u_\varepsilon]}{\mathcal{F}[u_\varepsilon]} = \inf_f \frac{\langle f, \mathcal{L} f \rangle}{\langle f, f \rangle} = \frac{\langle f_1, \mathcal{L} f_1 \rangle}{\langle f_1, f_1 \rangle} = \lambda_1 = \liminf_{\varepsilon \to 0} \frac{\mathcal{K}[u_\varepsilon]}{I[u_\varepsilon]}$$

If $\lim_{\varepsilon \to 0} \inf_f \frac{\mathcal{K}[u_\varepsilon]}{I[u_\varepsilon]} = C_2$, then $C_1 = C_2 = \lambda_1$

This happens if $\alpha = \alpha_{FS}$ and in particular in the case without weights (Gagliardo-Nirenberg inequalities)
