First Belgium-Chile-Italy conference in PDEs

Nov. 16, 2017
A short historical introduction to entropy methods in PDEs
On the notion of entropy

- In physics... the notion of entropy goes back to the 19th century: Gibbs, Clausius, Maxwell, Boltzmann
  - Thermodynamics: the steam engine
  - Boltzmann: how irreversibility arises in large systems
- Fundamental problems in Mathematics
  - Linked to the 6th Hilbert problem
- Information theory
  - Shannon, Rényi,...
  - What von Neumann said to Shannon: When Shannon first derived his famous formula for information, he asked von Neumann what he should call it and von Neumann replied: “You should call it entropy for two reasons: first because that is what the formula is in statistical mechanics but second and more important, as nobody knows what entropy is, whenever you use the term you will always be at an advantage!”

(to be continued)
Boltzmann’s equation describes the evolution of a gas of particles by

\[ \frac{\partial f}{\partial t} + v \cdot \nabla_x f = Q(f, f) \]

\( t \) is the time, \( x \) the position and \( v \) the velocity. \( f(t, x, v) \) is the distribution function (a probability density on the phase space). In a collision, if \( v \) and \( v_* \) are the incoming velocities and \( v' \) and \( v'_* \) the outgoing velocities, \( f_* = f(t, x, v_*) \), etc., then

\[ Q(f, f) = \int \int_{\mathbb{R}^3 \times S^2} \sigma(v - v_*, \omega) (f' f_* - f f_*) \, dv_* \, d\omega \]

is the collision kernel.

The cross-section \( \sigma \) is nonnegative and has symmetry properties.
Boltzmann’s $H$ theorem

Boltzmann’s entropy

$$H = \int \int_{\mathbb{R}^3 \times \mathbb{R}^3} f \log f \, dx \, dv$$

Boltzmann’s $H$ theorem

$$\frac{dH}{dt} = -\frac{1}{4} \int_{(\mathbb{R}^3)^3 \times S^2} \sigma(v - v_*, \omega) \cdot (f' f_*' - ff_*) \log \left( \frac{f' f_*'}{f f_*} \right) \, dv_* \, dv \, dx \, d\omega$$

▷ Carleman (< 1949): first mathematical theory
▷ Cercignani, Illner, Pulvirenti (1994): derivation of the equation

Can we compute a rate of convergence to an equilibrium using $H$?
On the notion of entropy (continued)

Many other domains of application:

- linear diffusions, Markov processes, semi-group theory... a long story! Bakry & Emery (1984): the carré du champ method
- PDEs and “entropy methods”: around 1998, Toscani et al., del Pino & JD (1999): the entropy for fast diffusion equations (a nonlinear case)

and also (not discussed here):

- Hyperbolic conservation laws
- Sinai’s entropy for measure-preserving dynamical system
- topological entropy, Perelman’s entropy in differential geometry
- etc.
Outline of the lecture

- Entropy methods and diffusion equations
  - $\varphi$-entropies and the \textit{carré du champ} method of Bakry & Emery
  - the gradient flow point of view
  - rigidity results and entropy methods on compact manifolds
  - Rényi entropy powers on the Euclidean space
  - weighted inequalities and results of symmetry
  - other applications: the (Patlak)-Keller-Segel in mathematical biology and the Oseen attractor in 2D Euler equations

- Hypocoercivity in kinetic equations
  - $H^1$ methods and $\varphi$-hypocoercivity
  - $L^2$-hypocoercivity
Entropy methods and diffusion equations

Rigidity results by entropy methods

Entropy methods
and
diffusion equations
φ-entropies: definition

The φ-entropy of a nonnegative function \( w \in L^1(\mathbb{R}^d, d\gamma) \) is

\[
\mathcal{E}[w] := \int_{\mathbb{R}^d} \varphi(w) \, d\gamma
\]

where \( \varphi : \mathbb{R}^+ \to \mathbb{R}^+ \) is such that

\[
\varphi'' \geq 0, \quad \varphi \geq \varphi(1) = 0 \quad \text{and} \quad \left(1/\varphi''\right)'' \leq 0
\]

A classical example of a such a function \( \varphi \) is given by

\[
\varphi_p(w) := \frac{1}{p-1} \left(w^p - 1 - p(w - 1)\right) \quad p \in (1, 2]
\]

▷ Case \( p = 2 \): \( \varphi_2(w) = (w - 1)^2 \)
▷ Limit case as \( p \to 1_+ \): \( \varphi_1(w) := w \log w - (w - 1) \)

d\(\gamma\) is a probability measure, which is absolutely continuous with respect to Lebesgue’s measure

\[
d\gamma = e^{-\psi} \, dx
\]
If $u$ solves the Fokker-Planck equation
\[
\frac{\partial u}{\partial t} = \Delta u + \nabla_x \cdot (u \nabla_x \psi).
\]
then $w = u e^\psi$ solves the Ornstein-Uhlenbeck or backward Kolmogorov equation
\[
\frac{\partial w}{\partial t} = L w := \Delta w - \nabla \psi \cdot \nabla w
\]
The Ornstein-Uhlenbeck operator $L$ on $L^2(\mathbb{R}^d, d\gamma)$ is such that
\[
- \int_{\mathbb{R}^d} (L w_1) w_2 \, d\gamma = \int_{\mathbb{R}^d} \nabla w_1 \cdot \nabla w_2 \, d\gamma \quad \forall w_1, w_2 \in H^1(\mathbb{R}^d, d\gamma)
\]
\[
\text{\triangleright } \text{the mass is conserved: } \int_{\mathbb{R}^d} w(t, \cdot) \, d\gamma = 1, \lim_{t \to +\infty} w(t, \cdot) = 1
\]
\[
\text{\triangleright } \text{the } \varphi\text{-entropy decays}
\]
\[
\frac{d}{dt} \mathcal{E}[w] = - \int_{\mathbb{R}^d} \varphi''(w) |\nabla_x w|^2 \, d\gamma =: - \mathcal{I}[w]
\]
where $\mathcal{I}[w]$ denotes the $\varphi$-Fisher information functional.
**ϕ-entropies: entropy – entropy production inequalities**

If for some $\Lambda > 0$ the *entropy – entropy production* inequality

$$J[w] \geq \Lambda \mathcal{E}[w] \quad \forall w \in H^1(\mathbb{R}^d, d\gamma)$$

holds, then

$$\mathcal{E}[w(t, \cdot)] \leq \mathcal{E}[w_0] e^{-\Lambda t} \quad \forall t \geq 0$$

**Example:** with $e^{-\psi} = (2\pi)^{-d/2} e^{-|x|^2/2}$ as $\varphi = \varphi_p$

$\triangleright$ $p = 2$, Gaussian Poincaré inequality : $\Lambda = 1$

$$\left\| f - \bar{f} \right\|_{L^2(\mathbb{R}^d, d\gamma)}^2 \leq \int_{\mathbb{R}^d} \left| \nabla f \right|^2 d\gamma \quad \forall f \in H^1(\mathbb{R}^d, d\gamma), \quad \bar{f} = \int_{\mathbb{R}^d} f d\gamma$$

$\triangleright$ $p = 1$, Logarithmic Sobolev inequality : $\Lambda = 2$

$$\int_{\mathbb{R}^d} f^2 \log \left( \frac{f^2}{\left\| f \right\|_{L^2(\mathbb{R}^d, d\gamma)}^2} \right) d\gamma \leq 2 \int_{\mathbb{R}^d} \left| \nabla f \right|^2 d\gamma \quad \forall f \in H^1(\mathbb{R}^d, d\gamma)$$
**ϕ-entropies: key properties**

- **Generalized Csiszár-Kullback-Pinsker inequality:**
  if \( A := \inf_{s \in (0, \infty)} s^{2-p} \varphi''(s) > 0 \), then
  \[
  \mathcal{E}[w] \geq 2^{-\frac{2}{p}} A \min \left\{ 1, \|w\|_{L^p(\mathbb{R}^d, d\gamma)}^{p-2} \right\} \|w - 1\|_{L^p(\mathbb{R}^d, d\gamma)}^2
  \]

- **Sub-additivity**
  \[
  \mathcal{E}_{\gamma_1 \otimes \gamma_2} [w] \leq \int_{\mathbb{R}^{d_2}} \mathcal{E}_{\gamma_1} [w] d\gamma_2 + \int_{\mathbb{R}^{d_1}} \mathcal{E}_{\gamma_2} [w] d\gamma_1
  \]

- **Tensorization**
  \[
  J_{\gamma_1 \otimes \gamma_2} [w] = \int_{\mathbb{R}^{d_1} \times \mathbb{R}^{d_2}} \varphi''(w) |\nabla w|^2 d\gamma_1 d\gamma_2 \geq \min\{\Lambda_1, \Lambda_2\} \mathcal{E}_{\gamma_1 \otimes \gamma_2} [w]
  \]

- **Generalized Holley-Stroock perturbation lemma:**
  if \( e^{-b} d\gamma \leq d\mu \leq e^{-a} d\gamma \) and \( \tilde{w} := \int_{\mathbb{R}^d} w d\mu / \int_{\mathbb{R}^d} d\mu \), then
  \[
  e^{a-b} \Lambda \int_{\mathbb{R}^d} \left[ \varphi(w) - \varphi(\tilde{w}) - \varphi'(\tilde{w})(w - \tilde{w}) \right] d\mu \leq \int_{\mathbb{R}^d} \varphi''(w) |\nabla w|^2 d\mu
  \]
Entropy methods and diffusion equations
Hypocoercivity in kinetic equations

ϕ-entropies: the carré du champ method

(Bakry, Emery, 1984): compute the $t$-derivative of Fisher
On a convex domain $\Omega$, with $w = z^2/p$ so that $J[w] = \int_\Omega |\nabla z|^2 \, d\gamma$

$$
\frac{1}{2} \frac{d}{dt} J[w] = - \frac{2}{p} (p - 1) \int_\Omega \|\text{Hess } z\|^2 \, d\gamma - \int_\Omega \text{Hess } \psi : \nabla z \otimes \nabla z \, d\gamma \\
- \frac{2 - p}{p} \int_\Omega \left\|\text{Hess } z - \frac{\nabla z \otimes \nabla z}{z}\right\|^2 \, d\gamma \\
+ \int_{\partial \Omega} \text{Hess } z : \nabla z \otimes \nu e^{-\psi} \, d\sigma \\
\leq - J[w]
$$

Key observations: $[\nabla, L] = - \text{Hess } \psi \ldots \text{ if } \psi(x) = |x|^2/2$

$$
\int_\Omega \text{Hess } \psi : \nabla z \otimes \nabla z \, d\gamma = \int_\Omega |\nabla z|^2 \, d\gamma = J[w]
$$

J. Dolbeault  ϕ-hypocoercivity
\(\varphi\)-entropies: a statement

Let \( p \in [1, 2] \) and assume that for any \( X \in H^1(\mathbb{R}^d, d\gamma)^d \)

\[
\frac{2}{p} (p - 1) \int_{\mathbb{R}^d} |\nabla X|^2 \, d\gamma + \int_{\mathbb{R}^d} \text{Hess } \psi : X \otimes X \, d\gamma \geq \Lambda(p) \int_{\mathbb{R}^d} |X|^2 \, d\gamma
\]

Theorem

Assume that \( q \in [1, 2) \). If \( \Lambda = \Lambda(2/q) > 0 \), then

\[
\frac{\|f\|_{L^2(\mathbb{R}^d, d\gamma)}^2 - \|f\|_{L^q(\mathbb{R}^d, d\gamma)}^2}{2 - q} \leq \frac{1}{\Lambda} \int_{\mathbb{R}^d} |\nabla f|^2 \, d\gamma \quad \forall f \in H^1(\mathbb{R}^d, d\gamma)
\]
\( \varphi \)-entropies: improved inequalities

Remainder terms: with \( \kappa_p = (p - 1) (2 - p)/p \)

\[
\frac{d}{dt} J[w] + 2 J[w] \leq - \kappa_p \frac{J[w]^2}{1 + (p - 1) \mathcal{E}[w]}
\]

Let \( e(t) := \frac{1}{p-1} \left( \int_{\mathbb{R}^d} f^2 \, d\gamma - 1 \right) \) where \( f = w^{p/2} \)

\[
e'' + 2 e' \geq \frac{\kappa_p |e'|^2}{1 + (p - 1) e} \geq \frac{\kappa_p |e'|^2}{1 + e}
\]

**Proposition**

Assume that \( q \in (1, 2) \) and \( d\gamma = (2\pi)^{-d/2} e^{-|x|^2/2} \, dx \)

With \( F(s) := \frac{1}{1 - \kappa_p} \left[ 1 + s - (1 + s)^{\kappa_p} \right] \), for any \( f \in H^1(\mathbb{R}^d, d\gamma) \) such that \( \|f\|_{L^q(\mathbb{R}^d, d\gamma)} = 1 \)

\[
\frac{1}{q} F \left( q \frac{\|f\|_{L^2(\mathbb{R}^d, d\gamma)}^2 - 1}{2 - q} \right) \leq \|\nabla f\|_{L^2(\mathbb{R}^d, d\gamma)}^2
\]
Bakry-Emery

Photo: Nassif Ghoussoub
ϕ-entropies: a summary

▷ To prove the decay of the entropy, we need an entropy – entropy production inequality \( \Lambda \mathcal{E} \leq \mathcal{I} \)

▷ The best constant in the entropy – entropy production inequality determines the (exponential) rate of decay: \( \mathcal{E}(t) \leq \mathcal{E}(0) e^{-\Lambda t} \)

▷ By differentiating this estimate at \( t = 0 \), we see that an exponential rate of decay is equivalent to an entropy – entropy production inequality: \( -\mathcal{I}(0) = \frac{d}{dt} \mathcal{E}(0) \leq -\Lambda \mathcal{E}(0) \)

▷ The carré du champ method: prove that \( \frac{d}{dt} (\mathcal{I}(t) - \Lambda \mathcal{E}(t)) \leq 0 \)

▷ With an improved inequality \( \Lambda F(\mathcal{E}) \leq \mathcal{I} \) where \( F'' > 0 \), \( F(0) = 0 \) and \( F'(0) = 0 \), optimality in the entropy – entropy production inequality can be achieved only in the asymptotic regime and \( \Lambda \) is given by a spectral gap of a linearized problem

▷ The Fokker-Planck equation can be seen as a gradient flow of the \( \phi \)-entropy under an appropriate notion of distance

Rigidity: the Bakry-Emery method on $S^d$

Entropy functional

$$\mathcal{E}_p[\rho] := \frac{1}{p-2} \left[ \int_{S^d} \rho^\frac{2}{p} \, d\mu - \left( \int_{S^d} \rho \, d\mu \right)^{\frac{2}{p}} \right] \quad \text{if} \quad p \neq 2$$

$$\mathcal{E}_2[\rho] := \int_{S^d} \rho \log \left( \frac{\rho}{\|\rho\|_{L^1(S^d)}} \right) \, d\mu$$

Fisher information functional

$$\mathcal{J}_p[\rho] := \int_{S^d} |\nabla \rho^{\frac{1}{p}}|^2 \, d\mu$$

Bakry-Emery (carré du champ) method: use the heat flow

$$\frac{\partial \rho}{\partial t} = \Delta \rho$$

and compute

$$\frac{d}{dt} \mathcal{E}_p[\rho] = - \mathcal{J}_p[\rho] \quad \text{and} \quad \frac{d}{dt} \mathcal{J}_p[\rho] \leq - d \mathcal{J}_p[\rho]$$

to get

$$\frac{d}{dt} \left( \mathcal{J}_p[\rho] - d \mathcal{E}_p[\rho] \right) \leq 0 \quad \implies \quad \mathcal{J}_p[\rho] \geq d \mathcal{E}_p[\rho]$$

with $\rho = |u|^p$, if $p \leq 2\# := \frac{2d^2+1}{(d-1)^2}$.
Rigidity: the fast diffusion flow on $S^d$

To overcome the limitation $p \leq 2^#$, one can consider a nonlinear diffusion of fast diffusion / porous medium type

$$\frac{\partial \rho}{\partial t} = \Delta \rho^m. \quad (1)$$

(Demange), (JD, Esteban, Kowalczyk, Loss): for any $p \in [1, 2^*]$

$$\mathcal{K}_p[\rho] := \frac{d}{dt} \left( J_p[\rho] - d \mathcal{E}_p[\rho] \right) \leq 0$$

$(p, m)$ admissible region, $d = 5$
Rigidity: the functional inequality

The entropy – entropy production method establishes the interpolation inequality

\[ \| \nabla u \|_{L^2(S^d)}^2 + \frac{d}{p-2} \| u \|_{L^2(S^d)}^2 \geq \frac{d}{p-2} \| u \|_{L^p(S^d)}^2 \quad \forall u \in H^1(S^d, d\mu) \]

where \( d\mu \) is the uniform probability measure on \( S^d \) and \( p \geq 1, p \neq 2 \) and \( p \leq 2^* := \frac{2d}{d-2} \) if \( d \geq 3 \)

The case \( p = 2 \) corresponds to the logarithmic Sobolev inequality

\[ \| \nabla u \|_{L^2(S^d)}^2 \geq \frac{d}{2} \int_{S^d} \frac{|u|^2}{\|u\|_{L^2(S^d)}^2} \log \left( \frac{|u|^2}{\|u\|_{L^2(S^d)}^2} \right) d\mu \quad \forall u \in H^1(S^d, d\mu) \setminus \{0\} \]

(Beatner, 1993)

(Bidaut-Véron, Véron, 1991)

(JD, Esteban, Kowalczyk, Loss)
Consider the nonlinear diffusion equation in $\mathbb{R}^d$, $d \geq 1$

\[ \frac{\partial v}{\partial t} = \Delta v^m \]

with initial datum $v(x, t = 0) = v_0(x) \geq 0$ such that $\int_{\mathbb{R}^d} v_0 \, dx = 1$ and $\int_{\mathbb{R}^d} |x|^2 v_0 \, dx < +\infty$. The large time behavior of the solutions is governed by the source-type Barenblatt solutions

\[ \mathcal{U}_*(t, x) := \frac{1}{(\kappa t^{1/\mu})^d} \mathcal{B}_* \left( \frac{x}{\kappa t^{1/\mu}} \right) \]

where

\[ \mu := 2 + d (m - 1), \quad \kappa := \left| \frac{2 \mu m}{m - 1} \right|^{1/\mu} \]

and $\mathcal{B}_*$ is the Barenblatt profile

\[ \mathcal{B}_*(x) := \begin{cases} (C_* - |x|^2)^{1/(m-1)} & \text{if } m > 1 \\ (C_* + |x|^2)^{1/(m-1)} & \text{if } m < 1 \end{cases} \]
The Rényi entropy power $F$

The *entropy* is defined by

$$E := \int_{\mathbb{R}^d} v^m \; dx$$

and the *Fisher information* by

$$I := \int_{\mathbb{R}^d} v |\nabla p|^2 \; dx \quad \text{with} \quad p = \frac{m}{m-1} v^{m-1}$$

If $v$ solves the fast diffusion equation, then

$$E' = (1 - m) I$$

To compute $I'$, we will use the fact that

$$\frac{\partial p}{\partial t} = (m - 1) p \Delta p + |\nabla p|^2$$

$$F := E^\sigma \quad \text{with} \quad \sigma = \frac{\mu}{d(1-m)} = 1 + \frac{2}{1-m} \left( \frac{1}{d} + m - 1 \right) = \frac{2}{d} \left( \frac{1}{1-m} - 1 \right)$$

has a linear growth asymptotically as $t \to +\infty$. 

J. Dolbeault
Rényi entropy power and Fisher information

Lemma

If \( v \) solves \( \frac{\partial v}{\partial t} = \Delta v^m \) with \( \frac{1}{d} \leq m < 1 \), then

\[
l' = \frac{d}{dt} \int_{\mathbb{R}^d} v |\nabla p|^2 \, dx = -2 \int_{\mathbb{R}^d} v^m \left( \|D^2 p\|^2 + (m - 1)(\Delta p)^2 \right) \, dx
\]

Explicit arithmetic geometric inequality

\[
\|D^2 p\|^2 - \frac{1}{d} (\Delta p)^2 = \left\|D^2 p - \frac{1}{d} \Delta p \mathrm{Id} \right\|^2
\]

Critical case: if \( m = 1 - \frac{1}{d} \): \( F' = l \) and the inequality \( l \geq l_* =: l[B_*] \) is Sobolev’s inequality
Rényi entropy power: the subcritical case

Theorem

(Toscani-Savaré) Assume that \( m \geq 1 - \frac{1}{d} \) if \( d > 1 \) and \( m > 0 \) if \( d = 1 \). Then \( (1 - m) F''(t) \leq 0 \)

(Dolbeault-Toscani) The inequality

\[
E^{\sigma-1} I \geq E^{\sigma-1}_* I_*
\]

is equivalent to the Gagliardo-Nirenberg inequality

\[
\| \nabla w \|_{L^2(\mathbb{R}^d)}^\theta \| w \|_{L^{q+1}(\mathbb{R}^d)}^{1-\theta} \geq C_{GN} \| w \|_{L^2(\mathbb{R}^d)}
\]

if \( 1 - \frac{1}{d} \leq m < 1 \)
Weighted inequalities and results of symmetry
Symmetry: critical Caffarelli-Kohn-Nirenberg inequality

Let \( \mathcal{D}_{a,b} := \left\{ v \in L^p(\mathbb{R}^d, |x|^{-b} \, dx) : |x|^{-a} |\nabla v| \in L^2(\mathbb{R}^d, dx) \right\} \)

\[
\left( \int_{\mathbb{R}^d} \frac{|v|^p}{|x|^{bp}} \, dx \right)^{2/p} \leq C_{a,b} \int_{\mathbb{R}^d} \frac{|\nabla v|^2}{|x|^{2a}} \, dx \quad \forall v \in \mathcal{D}_{a,b}
\]

holds under conditions on \( a \) and \( b \):
\( a < a_c = (d - 2)/2, \ a \leq b \leq a + 1 \) if \( d \geq 3 \)

\[
p = \frac{2d}{d - 2 + 2(b - a)} \quad (\text{critical case})
\]

▷ An optimal function among radial functions:

\[
v_\star(x) = \left(1 + |x|^{(p-2)(a_c-a)}\right)^{-\frac{2}{p-2}} \quad \text{and} \quad C_{a,b}^\star = \frac{\| |x|^{-b} v_\star \|^2_p}{\| |x|^{-a} \nabla v_\star \|^2_2}
\]

Question: \( C_{a,b} = C_{a,b}^\star \) (symmetry) or \( C_{a,b} > C_{a,b}^\star \) (symmetry breaking) ?
Symmetry: the sharp result in the critical case

The Felli & Schneider curve

\[ b_{FS}(a) := \frac{d (a_c - a)}{2\sqrt{(a_c - a)^2 + d - 1}} + a - a_c \]

(JD, Esteban, Loss, 2016)

**Theorem**

Let \( d \geq 2 \) and \( p < 2^* \). If either \( a \in [0, a_c) \) and \( b > 0 \), or \( a < 0 \) and \( b \geq b_{FS}(a) \), then the optimal functions for the critical Caffarelli-Kohn-Nirenberg inequalities are radially symmetric.
Symmetry: an approach based on Rényi entropy powers

We compute the derivative of the generalized Rényi entropy power functional

$$\frac{d}{dt} F[u] := \left( \int_{\mathbb{R}^d} u^m d\mu \right)^{\sigma^{-1}} \int_{\mathbb{R}^d} u |D_\alpha P|^2 d\mu$$

where $\sigma = \frac{2}{d} \frac{1}{1-m} - 1$. Here $d\mu = |x|^{n-d} dx$ and the pressure variable is

$$P := \frac{m}{1-m} u^{m-1}$$
Symmetry: the formal computation

With \( L_\alpha = -D_\alpha^* D_\alpha = \alpha^2 \left( u'' + \frac{n-1}{s} u' \right) + \frac{1}{s^2} \Delta_\omega u \), we consider the fast diffusion equation

\[
\frac{\partial u}{\partial t} = L_\alpha u^m
\]

in the subcritical range \( 1 - 1/n < m < 1 \). The key computation is the proof that

\[
- \frac{d}{dt} \mathcal{G}[u(t, \cdot)] \left( \int_{\mathbb{R}^d} u^m \, d\mu \right)^{1-\sigma} \\
\geq (1 - m) (\sigma - 1) \int_{\mathbb{R}^d} u^m \left| L_\alpha P - \frac{\int_{\mathbb{R}^d} u \, |D_\alpha P|^2 \, d\mu}{\int_{\mathbb{R}^d} u^m \, d\mu} \right|^2 \, d\mu \\
+ 2 \int_{\mathbb{R}^d} \left( \alpha^4 \left( 1 - \frac{1}{n} \right) \left| P'' - \frac{P'}{s} - \frac{\Delta_\omega P}{s^2} \right|^2 + \frac{2\alpha^2}{s^2} \left| \nabla_\omega P' - \frac{\nabla_\omega P}{s} \right|^2 \right) u^m \, d\mu
\]

for some numerical constant \( c(n, m, d) > 0 \). Hence if \( \alpha \leq \alpha_{FS} \), the r.h.s. \( \mathcal{H}[u] \) vanishes if and only if \( P \) is an affine function of \( |x|^2 \), which proves the symmetry result.
Other applications

The kinetic Fokker-Planck equation

\[
\frac{\partial f}{\partial t} + v \cdot \nabla_x f - \nabla_x \psi \cdot \nabla_v f = \Delta_v f + \nabla_v \cdot (v \nabla_v f)
\]

with \( \psi(x) = |x|^2/2 \). Under the condition \( \|f\|_{L^1(\mathbb{R}^d \times \mathbb{R}^d)} = 1 \), it has a unique stationary solution

\[f_\star(x, v) = (2 \pi)^{-\frac{d}{2}} e^{-\psi(x)} e^{-\frac{1}{2} |v|^2} = (2 \pi)^{-d} e^{-\frac{1}{2} (|x|^2 + |v|^2)} \quad \forall (x, v) \in \mathbb{R}^d \times \mathbb{R}^d\]

The function \( g := f / f_\star \) solves

\[\frac{\partial g}{\partial t} + T g = L g\]

where the transport operator \( T \) and the Ornstein-Uhlenbeck operator \( L \) are defined respectively by

\[T g := v \cdot \nabla_x g - x \cdot \nabla_v g \quad \text{and} \quad L g := \Delta_v g - v \cdot \nabla_v g\]

Let \( d\mu := f_\star \, dx \, dv \) be the invariant measure on \( \mathbb{R}^d \times \mathbb{R}^d \). 
An optimal decay rate

The function $h := g^{p/2}$ solves

$$\frac{\partial h}{\partial t} + \mathbf{T} h = \mathbf{L} h + \frac{2 - p}{p} \frac{|\nabla_v h|^2}{h}.$$

At the kinetic level, we consider the $\varphi_p$-entropy given by

$$\mathcal{E}[g] := \iint_{\mathbb{R}^d \times \mathbb{R}^d} \varphi_p(g) \, d\mu$$

**Proposition**

(Arnold, Erb) With the above notations there exists a constant $\mathcal{C} > 0$ for which

$$\mathcal{E}[g(t, \cdot, \cdot)] \leq \mathcal{C} e^{-t} \quad \forall \, t \geq 0$$
\(\varphi\)-hypocoercivity: the \(H^1\) approach

The method is based on the *Fisher information*

\[
\mathcal{J}[h] = \frac{1}{2} \int_{\mathbb{R}^d} |\nabla_v h|^2 \, d\mu + \frac{1}{2} \int_{\mathbb{R}^d} |\nabla_x h|^2 \, d\mu + \frac{1}{2} \int_{\mathbb{R}^d} |\nabla_x h + \nabla_v h|^2 \, d\mu
\]

which involves derivatives in \(x\) and \(v\)

A *carré du champ* computation shows that

\[
\frac{d}{dt} \mathcal{J}[h(t, \cdot)] \leq -\mathcal{J}[h(t, \cdot)]
\]

The result follows from the entropy – entropy production inequality

\[
\Lambda \mathcal{E}[g(t, \cdot, \cdot)] = \Lambda \mathcal{E}[h^{2/p}] \leq \mathcal{J}[h]
\]
\( \varphi \)-hypocoercivity: improved rate

Generalized (twisted, time-dependent) Fisher information functional

\[
\mathcal{J}_{\lambda}[h] = (1-\lambda) \int_{\mathbb{R}^d} |\nabla_v h|^2 \, d\mu + (1-\lambda) \int_{\mathbb{R}^d} |\nabla_x h|^2 \, d\mu + \lambda \int_{\mathbb{R}^d} |\nabla_x h + \nabla_v h|^2 \, d\mu
\]

Theorem

\textit{(JD, Li) Let} \( p \in (1,2) \). \textit{There exists a function} \( \lambda : \mathbb{R}^+ \to [1/2,1) \) \textit{and a continuous function} \( \rho \) \textit{on} \( \mathbb{R}^+ \) \textit{such that} \( \rho > 1/2 \) \textit{a.e., for which we have}

\[
\frac{d}{dt} \mathcal{J}_{\lambda(t)}[h(t, \cdot)] \leq -2 \rho(t) \mathcal{J}_{\lambda(t)}[h(t, \cdot)]
\]

\textit{As a consequence, for any} \( t \geq 0 \) \textit{we have the global estimate}

\[
\mathcal{J}_{\lambda(t)}[h(t, \cdot)] \leq \mathcal{J}_{\lambda(0)}[h_0] \exp \left( -2 \int_0^t \rho(s) \, ds \right)
\]
L^2-hypocoercivity

- Abstract statement
- A toy model
- Decay estimates
- Diffusion limits
An abstract evolution equation

Let us consider the equation

$$\frac{dF}{dt} + TF = LF$$

(2)

In the framework of kinetic equations, $T$ and $L$ are respectively the transport and the collision operators.

We assume that $T$ and $L$ are respectively anti-Hermitian and Hermitian operators defined on the complex Hilbert space $(\mathcal{H}, \langle \cdot, \cdot \rangle)$

$$A := (1 + (T\Pi)^*T\Pi)^{-1}(T\Pi)^*$$

* denotes the adjoint with respect to $\langle \cdot, \cdot \rangle$

$\Pi$ is the orthogonal projection onto the null space of $L$. 
Fokker-Planck kernels with general equilibria

We consider the Cauchy problem

$$\partial_t f + v \cdot \nabla_x f = Lf, \quad f(0, x, v) = f_0(x, v) \quad (3)$$

for a distribution function $f(t, x, v)$, with position variable $x \in \mathbb{R}^d$ or $x \in \mathbb{T}^d$ the flat $d$-dimensional torus

**Fokker-Planck** collision operator with a general equilibrium $M$

$$Lf = \nabla_v \cdot \left[ M \nabla_v \left( M^{-1} f \right) \right]$$

An **admissible local equilibrium** $M$ is positive, radially symmetric and

$$\int_{\mathbb{R}^d} M(v) \, dv = 1, \quad d\gamma = \gamma(v) \, dv := \frac{dv}{M(v)}$$

Typical example: $M(v) = (2\pi)^{-d/2} e^{-\frac{1}{2} |v|^2} + \text{some technical assumptions (H)}$
Scattering collision operators

*Scattering* collision operator

\[ \mathbb{L}f = \int_{\mathbb{R}^d} \sigma(\cdot, v') (f(v') M(\cdot) - f(\cdot) M(v')) \, dv' \]

Main assumption on the *scattering rate* \(\sigma\): for some positive, finite \(\bar{\sigma}\)

\[ 1 \leq \sigma(v, v') \leq \bar{\sigma} \quad \forall v, v' \in \mathbb{R}^d \]

Example: linear BGK operator

\[ \mathbb{L}f = M \rho_f - f, \quad \rho_f(t, x) = \int_{\mathbb{R}^d} f(t, x, v) \, dv \]

*Local mass conservation*

\[ \int_{\mathbb{R}^d} \mathbb{L}f \, dv = 0 \]
The assumptions

$\lambda_m$, $\lambda_M$, and $C_M$ are positive constants such that, for any $F \in \mathcal{H}$

- **microscopic coercivity:**
  \[ -\langle LF, F \rangle \geq \lambda_m \| (1 - \Pi)F \|^2 \quad (H1) \]

- **macroscopic coercivity:**
  \[ \| T\Pi F \|^2 \geq \lambda_M \| \Pi F \|^2 \quad (H2) \]

- **parabolic macroscopic dynamics:**
  \[ \Pi T\Pi F = 0 \quad (H3) \]

- **bounded auxiliary operators:**
  \[ \| A_T(1 - \Pi)F \| + \| ALF \| \leq C_M \| (1 - \Pi)F \| \quad (H4) \]

The estimate
\[
\frac{1}{2} \frac{d}{dt} \| F \|^2 = \langle LF, F \rangle \leq -\lambda_m \| (1 - \Pi)F \|^2
\]

is not enough to conclude that $\| F(t, \cdot) \|^2$ decays exponentially
Equivalence and entropy decay

For some $\delta > 0$ to be determined later, the $L^2$ entropy / Lyapunov functional is defined by

$$H[F] := \frac{1}{2} \|F\|^2 + \delta \text{Re}\langle AF, F \rangle$$

as in (Dolbeault-Mouhot-Schmeiser) so that $\langle AT\Pi F, F \rangle \sim \|\Pi F\|^2$ and

$$- \frac{d}{dt} H[F] = : D[F]$$

$$= - \langle LF, F \rangle + \delta \langle AT\Pi F, F \rangle$$

$$- \delta \text{Re}\langle TF, F \rangle + \delta \text{Re}\langle AT(1-\Pi)F, F \rangle - \delta \text{Re}\langle ALF, F \rangle$$

$\triangleright$ for any $\delta > 0$ small enough and $\lambda = \lambda(\delta)$

$$\lambda H[F] \leq D[F]$$

$\triangleright$ norm equivalence of $H[F]$ and $\|F\|^2$

$$\frac{2 - \delta}{4} \|F\|^2 \leq H[F] \leq \frac{2 + \delta}{4} \|F\|^2$$
Exponential decay of the entropy

\[ \lambda = \frac{\lambda_M}{3(1+\lambda_M)} \min \left\{ 1, \lambda_m, \frac{\lambda_m \lambda_M}{(1+\lambda_M)C^2_M} \right\}, \quad \delta = \frac{1}{2} \min \left\{ 1, \lambda_m, \frac{\lambda_m \lambda_M}{(1+\lambda_M)C^2_M} \right\} \]

\[ h_1(\delta, \lambda) := (\delta C_M)^2 - 4 \left( \lambda_m - \delta - \frac{2 + \delta}{4} \lambda \right) \left( \frac{\delta \lambda_M}{1 + \lambda_M} - \frac{2 + \delta}{4} \lambda \right) \]

**Theorem**

Let \( L \) and \( T \) be closed linear operators (respectively Hermitian and anti-Hermitian) on \( \mathcal{H} \). Under (H1)–(H4), for any \( t \geq 0 \)

\[ H[F(t, \cdot)] \leq H[F_0] e^{-\lambda_\star t} \]

where \( \lambda_\star \) is characterized by

\[ \lambda_\star := \sup \{ \lambda > 0 : \exists \delta > 0 \text{ s.t. } h_1(\delta, \lambda) = 0, \lambda_m - \delta - \frac{1}{4} (2 + \delta) \lambda > 0 \} \]
Hypocoercivity

Corollary

For any $\delta \in (0, 2)$, if $\lambda(\delta)$ is the largest positive root of $h_1(\delta, \lambda) = 0$ for which $\lambda_m - \delta - \frac{1}{4} (2 + \delta) \lambda > 0$, then for any solution $F$ of (2)

$$\|F(t)\|^2 \leq \frac{2 + \delta}{2 - \delta} e^{-\lambda(\delta) t} \|F(0)\|^2 \quad \forall t \geq 0$$

From the norm equivalence of $H[F]$ and $\|F\|^2$

$$\frac{2 - \delta}{4} \|F\|^2 \leq H[F] \leq \frac{2 + \delta}{4} \|F\|^2$$

We use $\frac{2 - \delta}{4} \|F_0\|^2 \leq H[F_0]$ so that $\lambda_* \geq \sup_{\delta \in (0, 2)} \lambda(\delta)$
A toy problem

\[
\frac{du}{dt} = (L-T)u, \quad L = \begin{pmatrix} 0 & 0 \\ 0 & -1 \end{pmatrix}, \quad T = \begin{pmatrix} 0 & -k \\ k & 0 \end{pmatrix}, \quad k^2 \geq \Lambda > 0
\]

Non-monotone decay, a well known picture:
see for instance (Filbet, Mouhot, Pareschi, 2006)

- H-theorem: \( \frac{d}{dt} |u|^2 = -2u_2^2 \)
- macroscopic limit: \( \frac{du_1}{dt} = -k^2 u_1 \)
- generalized entropy: \( H(u) = |u|^2 - \frac{\delta k}{1+k^2} u_1 u_2 \)

\[
\frac{dH}{dt} = - \left( 2 - \frac{\delta k^2}{1+k^2} \right) u_2^2 - \frac{\delta k^2}{1+k^2} u_1^2 + \frac{\delta k}{1+k^2} u_1 u_2 \\
\leq - (2 - \delta) u_2^2 - \frac{\delta \Lambda}{1+\Lambda} u_1^2 + \frac{\delta}{2} u_1 u_2
\]
Plots for the toy problem
Further results

(Bouin, JD, Mouhot, Mischler, Schmeiser)
▷ It is possible to make a mode by mode analysis in Fourier variables
▷ On the whole space without confinement potential ($\psi \equiv 0$), we obtain rates of decay using Nash’s inequality

Consider

$$\partial_t f + v \cdot \nabla_x f = Lf, \quad f(0, x, v) = f_0(x, v)$$

for a distribution function $f(t, x, v)$, with position variable in the whole space, $x \in \mathbb{R}^d$, and with time $t \geq 0$

(a) Fokker-Planck collision operator:

$$Lf = \nabla_v \cdot \left[ M \nabla_v \left( M^{-1} f \right) \right]$$

(b) Scattering collision operator:

$$Lf = \int_{\mathbb{R}^d} \sigma(\cdot, v') \left( f(v') M(\cdot) - f(\cdot) M(v') \right) dv'$$
A statement

A typical example of a local equilibrium $M$ is the Gaussian function

$$M(v) = \frac{e^{-\frac{1}{2} |v|^2}}{(2\pi)^{d/2}}$$

but our results apply to more general functions $M$

**Theorem**

Let us consider an admissible $M$ and a collision operator $L$ satisfying some additional technical assumptions. Assume that $x \in \mathbb{R}^d$, and $\gamma_k(v) = (1 + |v|^2)^{k/2}$ for some $k \in (d, \infty]$. There exists a constant $C > 0$ such that the solution $f$ satisfies

$$\|f(t, \cdot, \cdot)\|_{L^2(dx\,d\gamma_k)}^2 \leq C \left( \|f_0\|_{L^2(dx\,d\gamma_k)}^2 + \|f_0\|_{L^2(d\gamma_k; L^1(dx))}^2 \right) (1 + t)^{-\frac{d}{2}}$$
Diffusion limits: from kinetic equations to diffusions
BGK-type kinetic equation as a motivation for nonlinear diffusions – polynomials and fast diffusion / porous medium

\[ \varepsilon^2 \partial_t f^\varepsilon + \varepsilon v \cdot \nabla_x f^\varepsilon - \varepsilon \nabla_x V(x) \cdot \nabla_v f^\varepsilon = G_{f^\varepsilon} - f^\varepsilon \]

\[ f^\varepsilon(x, v, t = 0) = f_I(x, v), \quad x, v \in \mathbb{R}^3 \]

with the Gibbs equilibrium \( G_f := \gamma \left( \frac{|v|^2}{2} + V(x) - \mu_{\rho_f}(x, t) \right) \)

The Fermi energy \( \mu_{\rho_f}(x, t) \) is implicitly defined by

\[ \int_{\mathbb{R}^3} \gamma \left( \frac{|v|^2}{2} + V(x) - \mu_{\rho_f}(x, t) \right) dv = \int_{\mathbb{R}^3} f(x, v, t) dv =: \rho_f(x, t) \]

\[ f^\varepsilon(x, v, t) \quad \text{... phase space particle density} \]

\[ V(x) \quad \text{... potential} \]

\[ \varepsilon \quad \text{... mean free path} \]

\[ \Rightarrow \quad \mu_{\rho_f} = \bar{\mu}(\rho_f) \]
Diffusion limits

(J.D., P. Markowich, D. Ölz, C. Schmeiser)

**Theorem**

For any $\varepsilon > 0$, the equation has a unique weak solution $f^\varepsilon \in C(0, \infty; L^1 \cap L^p(\mathbb{R}^6))$ for all $p < \infty$. As $\varepsilon \to 0$, $f^\varepsilon$ weakly converges to a local Gibbs state $f^0$ given by

$$f^0(x,v,t) = \gamma \left( \frac{1}{2} |v|^2 - \bar{\mu}(\rho(x,t)) \right)$$

where $\rho$ is a solution of the nonlinear diffusion equation

$$\partial_t \rho = \nabla_x \cdot (\nabla_x \nu(\rho) + \rho \nabla_x V(x))$$

with initial data $\rho(x,0) = \rho_I(x) := \int_{\mathbb{R}^3} f_I(x,v) \, dv$

$$\nu(\rho) = \int_0^\rho s \bar{\mu}'(s) \, ds$$
