where *K* is an interaction kernel. **Question :** What happens when $N \rightarrow \infty$?

In a system of N interacting particles, as N increases, two particles become more and more statistically independent.

Synchronous coupling-2

By Gronwall's lemma and exchangeability

$$\mathbb{E}\left(|X_t^i-\bar{X}_t^i|\right) \leq e^{2Lt}\left(\mathbb{E}\left(|X_0^i-\bar{X}_0^i|\right) + \frac{C}{\sqrt{N}}\right).$$

and thus

$$\mathcal{W}_1\left(\rho_t^{k,N}, \bar{\rho}_t^{\otimes k}\right) \leq \mathbb{E}\left(\sum_{i=1}^k |X_t^i - \bar{X}_t^i|\right) \leq e^{2Lt}\left(\mathbb{E}\left(\sum_{i=1}^k |X_0^i - \bar{X}_0^i|\right) + \frac{Ck}{\sqrt{N}}\right)$$

Because this holds for any initial coupling of $\rho_0^{k,N}$ and $\bar{\rho}_0^{\otimes k}$,

$$\mathcal{W}_1\left(\rho_t^{k,N},\bar{\rho}_t^{\otimes k}\right) \leq e^{2Lt}\left(\mathcal{W}_1\left(\rho_0^{k,N},\bar{\rho}_0^{\otimes k}\right) + \frac{Ck}{\sqrt{N}}\right).$$

Theorem (Guillin-LB-Monmarché ('22))

Let $C^0 > 0$ and a > 0. Let $U \in C^1(\mathbb{R}^d)$ satisfy the previous assumption. There is an explicit $c^W > 0$ such that, for all $W \in C^1(\mathbb{R}^d)$ satisfying $L_W < c^W$, there exist explicit $B_1, B_2 > 0$, such that for all probability measures ν_0 on \mathbb{R}^{2d} (under some initial moment assumption depending on C^0 and a) and for all $t \ge 0$,

$$\mathcal{W}_1\left(\nu_t^{k,N}, \bar{\nu}_t^{\otimes k}\right) \leq \frac{kB_1}{\sqrt{N}}, \qquad \mathcal{W}_2^2\left(\nu_t^{k,N}, \bar{\nu}_t^{\otimes k}\right) \leq \frac{kB_2}{\sqrt{N}},$$

for all $k \in \mathbb{N}$, where $\nu_t^{k,N}$ is the marginal distribution at time t of the first k particles $((X_t^1, V_t^1), ..., (X_t^k, V_t^k))$ of an N particle system (PS) with initial distribution $(\nu_0)^{\otimes N}$, while $\bar{\nu}_t$ is the probability densities of (NL) with initial distribution ν_0 .

Some remarks on the method

Pros :

• Quantitative,

• Yields/Uses a probabilistic understanding of the result,

• "Quite" robust...

Cons :

- Not sharp in N (cf. Lacker),
- So far, restricted to "nice" interactions...

Various distances

For $\mathbf{x} = (x_i)_{i \in [\![1,N]\!]} \in \mathbb{T}^{dN}$, we write $\pi(\mathbf{x}) = \frac{1}{N} \sum_{i=1}^{N} \delta_{x_i}$ the associated empirical measure.

Corollary

Under some assumptions (satisfied by the Biot-Savart kernel), assuming moreover that $\rho_0^N = \overline{\rho}_0^N$, there is a constant *C* such that for all $k \leq N \in \mathbb{N}$ and all $t \geq 0$,

$$\|\rho_t^{k,N} - \bar{\rho}_t^k\|_{L^1} + \mathcal{W}_2\left(\rho_t^{k,N}, \bar{\rho}_t^k\right) \le C\left(\left\lfloor \frac{N}{k} \right\rfloor\right)^{-\frac{1}{2}}$$

and

$$\mathbb{E}_{\rho_t^N} \left(\mathcal{W}_2(\pi(\mathbf{X}), \bar{\rho}_t) \right) \leqslant C\alpha(N)$$

where $\alpha(N) = N^{-1/2} \ln(1+N)$ if $d = 2$ and $\alpha(N) = N^{-1/d}$ if $d > 2$.

Theorem (Jabin-Wang '18)

Consider any probability measure μ on \mathbb{T}^d , $\epsilon > 0$ and a scalar function $\psi \in L^{\infty}(\mathbb{T}^d \times \mathbb{T}^d)$ with $\|\psi\|_{L^{\infty}} < \frac{1}{2\epsilon}$ and such that for all $z \in \mathbb{T}^d$, $\int_{\mathbb{T}^d} \psi(z, x)\mu(dx) = 0$. Then there exists a constant C such that

$$\int_{\mathbb{T}^{dN}} \exp\Big(\frac{1}{N} \sum_{j_1, j_2=1}^N \psi(x_1, x_{j_1}) \psi(x_1, x_{j_2})\Big) \mu^{\otimes N} d\boldsymbol{X}^N \leq C,$$

where C depends on

$$lpha = ig(\epsilon \| \psi \|_{L^\infty}ig)^4 < \mathsf{1}$$
 , $eta = ig(\sqrt{2\epsilon} \| \psi \|_{L^\infty}ig)^4 < \mathsf{1}.$

Theorem (Jabin-Wang '18)

Consider any probability measure μ on \mathbb{T}^d and $\phi \in L^{\infty}(\mathbb{T}^d \times \mathbb{T}^d)$ with

$$\gamma := \left(1600^2 + 36e^4\right) \left(\sup_{p \ge 1} \frac{\|\sup_{z} |\phi(\cdot, z)|\|_{L^p(\mu))}}{p}\right)^2 < 1.$$

Assume that ϕ satisfies the following cancellations

$$\forall z \in \mathbb{T}^d, \quad \int_{\mathbb{T}^d} \phi(x, z) \mu(dx) = 0 = \int_{\mathbb{T}^d} \phi(z, x) \mu(dx).$$

Then, for all $N \in \mathbb{N}$,

$$\int_{\mathbb{T}^{dN}} \exp\Big(\frac{1}{N}\sum_{i,j=1}^{N} \phi(x_i, x_j)\Big) \mu^{\otimes N} d\mathbf{X}^N \leq \frac{2}{1-\gamma} < \infty.$$

Assumptions?

Goal :
$$K(x) = \frac{1}{2\pi} \frac{x^{\perp}}{|x|^2} = \frac{1}{2\pi} \left(-\frac{x_2}{|x|^2}, \frac{x_1}{|x|^2} \right)$$

Justifying the calculations

• There is $\lambda > 1$ such that $\bar{\rho}_0 \in C^{\infty}_{\lambda}(\mathbb{T}^d)$ $\implies \bar{\rho} \in C^{\infty}_{\lambda}(\mathbb{R}^+ \times \mathbb{T}^d)$ (Ben-Artzi '94) • $\rho^N \in C^{\infty}_{\lambda}(\mathbb{R}^+ \times \mathbb{T}^{Nd})$ (???)

Dealing with the terms

- In the sense of distributions, $\nabla \cdot K = 0$.
- There is a matrix field $V \in L^{\infty}$ such that $K = \nabla \cdot V$, i.e for $1 \leq \alpha \leq d$, $K_{\alpha} = \sum_{\beta=1}^{d} \partial_{\beta} V_{\alpha,\beta}$ (Phuc-Torres '08).

Uniformity in time

- For all $n \geq 1, \ C_n^0 := \| \nabla^n \bar{\rho}_0 \|_{L^\infty} < \infty$
- $\|K\|_{L^1} < \infty$ (also used to show regularity).

(ロ)、(型)、(E)、(E)、(E) の(C) 56/62

Lemma

Let $(\mu^N)_{N \in \mathbb{N}}$ be any sequence of independent empirical measures, such that μ_t^N is the empirical measure of the N particle system at time t. Then (for $\lambda > 0$, $\alpha = 1$, $U'(x) = \lambda x$ and $\sigma_N = \frac{1}{N}$), we have for all $t \ge 0$ and all $N, M \ge 1$

$$\mathbb{E}\left(\mathcal{W}_{2}\left(\mu_{t}^{N},\mu_{t}^{M}\right)^{2}\right) \leq e^{-2\lambda t}\mathbb{E}\left(\mathcal{W}_{2}\left(\mu_{0}^{N},\mu_{0}^{M}\right)^{2}\right) + \frac{C}{N \wedge M}$$

Remark : The same result holds ...

- for U = 0, but no longer uniform in time,
- for $\alpha \in [1, 2[$, with rate $N^{-\frac{2-\alpha}{\alpha}}$,
- for U' only Lipschitz continuous, but no longer uniform in time,

Conclusion

Using independence, this implies that there exists a (deterministic) $\bar{\rho}_t$ such that

$$\mathbb{E}\left(\mathcal{W}_{2}(\mu_{t}^{N},\bar{\rho}_{t})^{2}\right)
ightarrow\mathbf{0},$$

which satisfies, for all functions *f* "sufficiently nice" and $\forall t \ge 0$,

$$\int_{\mathbb{R}} f(x) ar{
ho}_t(dx) = \int_{\mathbb{R}} f(x) ar{
ho}_0(dx) - \int_0^t \int_{\mathbb{R}} f'(x) U'(x) ar{
ho}_s(dx) ds \ + rac{1}{2} \int_0^t \int \int_{\{x
eq y\}} rac{(f'(x) - f'(y))(x - y)}{|x - y|^{lpha + 1}} ar{
ho}_s(dx) ar{
ho}_s(dy) ds.$$

Proof of the estimate

For two sets of points $(x_i)_{i \in \{1,...,N\}}$ and $(y_j)_{j \in \{1,...,N\}}$, with $x_1 \le ... \le x_N$ and $y_1 \le ... \le y_N$, and two measures $\mu = \frac{1}{N} \sum_i \delta_{x_i}$ and $\nu = \frac{1}{N} \sum_j \delta_{y_j}$:

$$W_2(\mu,\nu)^2 = \frac{1}{N}\sum_i |x_i - y_i|^2.$$

Let

$$\begin{split} -\infty < & X_t^1 = \ldots = X_t^N < \ldots < X_t^{N(M-1)+1} = \ldots = X_t^{NM} < \infty \\ -\infty < & Y_t^1 = \ldots = Y_t^M < \ldots < Y_t^{M(N-1)+1} = \ldots = Y_t^{NM} < \infty. \end{split}$$

Thus

$$\mu_t^M = \frac{1}{M} \sum_{i=1}^M \delta_{\tilde{X}_t^{i,M}} = \frac{1}{NM} \sum_{i=1}^{NM} \delta_{X_t^i} \quad \text{and} \quad \mu_t^N = \frac{1}{N} \sum_{i=1}^N \delta_{\tilde{Y}_t^{i,N}} = \frac{1}{NM} \sum_{i=1}^{NM} \delta_{Y_t^i},$$

and

$$\mathcal{W}_{2}\left(\mu_{t}^{N},\mu_{t}^{M}
ight)^{2}=rac{1}{NM}\sum_{i=1}^{NM}\left|X_{t}^{i}-Y_{t}^{i}
ight|^{2}$$
