Chapter 1 - Variational solution for parabolic equation

1 Introduction (September 25th, 2013)

In this first lesson we will focus on the question of existence (and uniqueness) of a solution $f = f(t, x)$ to the evolution PDE of "parabolic type"

\begin{equation}
\partial_t f = \Lambda f \quad \text{on} \quad (0, \infty) \times \mathbb{R}^d,
\end{equation}

where $\Lambda$ is the following integro-differential operator

\begin{equation}
(\Lambda f)(x) = \Delta f(x) + a(x) \cdot \nabla f(x) + c(x) f(x) + \int_{\mathbb{R}^d} b(y, x) f(y) \, dy,
\end{equation}

that we complement by an initial condition

\begin{equation}
f(0, x) = f_0(x) \quad \text{in} \quad \mathbb{R}^d.
\end{equation}

Here $t \geq 0$ stands for the "time" variable, $x \in \mathbb{R}^d$, $d \in \mathbb{N}^*$, stands for the "position" variable.

In order to develop the variational approach for the equation (1.1)-(1.2), we make the strong assumption that $f_0 \in L^2(\mathbb{R}^d) =: H$, which is an Hilbert space, and that the coefficients satisfy

\begin{equation}
a \in W^{1,\infty}(\mathbb{R}^d), \quad c \in L^\infty(\mathbb{R}^d), \quad b \in L^2(\mathbb{R}^d \times \mathbb{R}^d).
\end{equation}

The main result we will present in this chapter is the existence of a weak (variational) solution (which sense will be specified bellow)

\begin{equation}
f \in X_T := C([0, T); L^2) \cap L^2(0, T; H^1) \cap H^1(0, T; H^{-1}), \quad \forall \, T,
\end{equation}

to the evolution equation (1.1)- (1.3). We mean variational solution because the space of “test functions” is the same as the space in which the solution lives. It also refers to the associated stationary problem which is of “variational type” (see Chapter VIII & IX in the book “Functional Analysis” by H. Brézis).

The existence of solutions issue is tackled by following a scheme of proof that we will repeat for all the other evolution equations that we will consider in the next chapters.

1. We look for a priori estimates by performing (formal) differential and integral calculus.
2. We deduce a possible natural functional space in which lives a solution and we propose a definition of a solution, that is a (weak) sense in which we may understand the evolution equation.
3. We state and prove the associated existence theorem. For the existence proof we typically argue as follows : we introduce a “regularized problem” for which we are able to construct a solution and we are allowed to rigorously perform the calculus leading to the “a priori estimates” and then we pass to the limit in the sequence of regularized solutions.
2 A priori estimates

Define \( V = H^1(\mathbb{R}^d) \). We first observe that for any \( f \in V \)
\[
\langle Af,f \rangle = -\int |\nabla f|^2 + \int a \cdot \nabla_x f^2 + \int c f^2 + \int \int b(y,x) f(x) f(y) \, dx \, dy.
\]
\[
\leq -\|f\|_V^2 + \left(1 + \frac{1}{2} \|a\|_{L^\infty} + \|c\|_{L^\infty} + \|b\|_{L^2}\right) \|f\|_H^2.
\]

We also observe that for any \( f,g \in V \)
\[
|\langle \Lambda f,g \rangle| \leq \|\nabla f\|_{L^2} \|\nabla g\|_{L^2} + \|a\|_{L^\infty} \|f\|_{L^2} \|g\|_{L^2} + (\|c\|_\infty + \|b\|_{L^2}) \|f\|_{L^2} \|g\|_{L^2}
\]
\[
\leq \left(1 + \|a\|_\infty + \|c\|_\infty + \|b\|_{L^2}\right) \|f\|_V \|g\|_V.
\]

We easily deduce from the two preceding estimates that our parabolic operator falls in the following abstract variational framework.

**Abstract variational framework.** We consider an Hilbert space \( H \) endowed with the scalar product \((\cdot,\cdot)\) and the norm \(|\cdot|\). We identify \( H \) with its dual \( H' = H \). We consider another Hilbert space \( V \) endowed with a norm \( \|\cdot\|_V \) and we denote \( \langle \cdot, \cdot \rangle \) the duality product on \( V \). We assume \( V \subset H \) with dense and bounded embedding so that \( V \subset H \subset V' \).

We consider a linear operator \( \Lambda : V \to V' \) which is bounded (or continuous), which means

(i) \( \exists M > 0 \) such that
\[
|\langle \Lambda g, h \rangle| \leq M \|g\| \|h\| \quad \forall g, h \in V;
\]
and which is "(strongly/variationally) dissipative" in the sense

(ii) \( \exists \alpha > 0, b \in \mathbb{R} \) such that
\[
\langle \Lambda g, g \rangle \leq -\alpha \|g\|^2 + b \|g\|^2 \quad \forall g \in V;
\]

and we consider the abstract evolution equation

(2.1) \[
\frac{dg}{dt} = \Lambda g \quad \text{in} \quad (0,T),
\]

for a solution \( g : [0,T) \to H \), with prescribed initial value

(2.2) \[
g(0) = g_0 \in H.
\]

**A priori bound in the abstract variational framework.** With the above assumptions and notations, any solution \( g \) to the abstract evolution equation (2.1) (formally) satisfies the following estimate

(2.3) \[
\|g(T)\|_H^2 + 2\alpha \int_0^T \|g(s)\|^2_V \, ds \leq e^{2\alpha T} \|g_0\|_H^2 \quad \forall T.
\]

We (formally) prove (2.3). Using just the dissipativity assumption (ii), we have
\[
\frac{d}{dt} |g(t)|_H^2 = \langle \Lambda g, g \rangle \leq -\alpha \|g(t)\|_V^2 + b \|g(t)\|_H^2,
\]
and we conclude thanks to the Gronwall lemma, that we recall now.

**Lemma 2.1 (Gronwall)** Consider \( 0 \leq u \in C^1([0,T]), \; 0 \leq v \in C([0,T]) \) and \( \alpha, b \geq 0 \) such that

(2.4) \[
u' + 2\alpha v \leq 2\alpha u \quad \text{in a point wise sense on} \quad (0,T),
\]
or more generally $0 \leq u \in C([0,T])$ and $0 \leq v \in L^1(0,T)$ which satisfies (2.4) in the distributional sense, namely

$$u(t) + 2\alpha \int_0^t v(s) \, ds \leq 2b \int_0^t u(s) \, ds + u(0) \quad \forall t \in (0,T).$$

Then, the following estimate holds true

$$u(t) + 2\alpha \int_0^t v(s) \, ds \leq e^{2bt} u(0) \quad \forall t \in (0,T).$$

**Proof of Lemma 2.1** Since (2.4) clearly implies (2.5), we just have to prove that (2.5) implies (2.6). We introduce the $C^1$ function

$$w(t) := 2b \int_0^t u(s) \, ds + u(0).$$

Differentiate $w$, we get thanks to (2.5)

$$w'(t) = 2bu(t) \leq 2bw(t)$$

so that

$$w(t) \leq e^{2bt} w(0) = e^{2bt} u(0).$$

We conclude by coming back to (2.5). \qed

From the formal/natural/physics estimate (2.3) together with equation (2.1) and the continuity estimate (i) on $\Lambda$, we deduce

$$\| \frac{dg}{dt} \|_{V'} = \| \Lambda g \|_{V'} \leq M \| g \|_V \in L^2(0,T),$$

and we conclude with

$$g \in L^\infty(0,T;H) \cap L^2(0,T;V) \cap H^1(0,T;V').$$

### 3 Variational solutions

**Definition 3.1** For any given $g_0 \in H$, $T > 0$, we say that

$$g = g(t) \in X_T := C([0,T];H) \cap L^2(0,T;V) \cap H^1(0,T;V')$$

is a variational solution to the Cauchy problem (2.1), (2.2) on the time interval $[0,T]$ if it is a solution in the following weak sense

$$(g(t), \varphi(t))_H = (g_0, \varphi(0))_H + \int_0^t \{ \langle \Lambda g(s), \varphi(s) \rangle_{V',V} + \langle \varphi'(s), g(s) \rangle_{V',V} \} \, ds$$

for any $\varphi \in X_T$ and any $0 \leq t_1 \leq t_2 \leq T$.

We say that $g$ is a global solution if it is a solution on $[0,T]$ for any $T > 0$.

**Theorem 3.2 (J.L. Lions)** With the above notations and assumptions for any $g_0 \in H$, there exists a unique global variational solution to the Cauchy problem (2.1), (2.2).

As a consequence, any solution satisfies (2.3) and the application $g_0 \mapsto g(t)$ defines a $C_0$-semigroup on $H$.

We start with some remarks and we postpone the proof of the existence part of Theorem 3.2 to the next section.
3.1 Parabolic equation.

As a consequence of Theorem 3.2, for any \( f_0 \in L^2(\mathbb{R}^d) \) there exists a unique function

\[
f = f(t) \in C([0, T]; L^2) \cap L^2(0, T; H^1) \cap H^1(0, T; H^{-1}), \quad \forall T > 0,
\]

which is a solution to the parabolic equation (1.1)-(1.2) in the variational sense.

3.2 About the functional space.

The space obtained thanks to the a priori estimates established on \( g \) is nothing but \( X_T \) as consequence of the following result.

**Lemma 3.3** The following inclusion

\[
L^2(0, T; V) \cap H^1(0, T; V') \subset C([0, T]; H)
\]

holds true. Moreover, for any \( g \in L^2(0, T; V) \cap H^1(0, T; V') \) there holds

\[
t \mapsto |g(t)|^2_H \in W^{1,1}(0, T)
\]

and

\[
\frac{d}{dt} |g(t)|^2_H = 2 \langle g'(t), g(t) \rangle_{V', V} \quad \text{a.e. on} \quad (0, T).
\]

**Proof of Lemma 3.3** Step 1. We define \( g_\varepsilon(t) := g * \rho_\varepsilon \) for a mollifier \( \rho_\varepsilon \) with compact support included in \((0, \infty)\) so that \( g_\varepsilon \in C^1([0, T - \delta]; V) \) for any \( \delta \in (0, T) \) and for any \( \varepsilon > 0 \) small enough. We fix \( \varepsilon, \varepsilon' > 0 \) and we compute

\[
\frac{d}{dt} |g_\varepsilon(t) - g_{\varepsilon'}(t)|^2_H = 2 \langle g_\varepsilon' - g_{\varepsilon'}, g_\varepsilon - g_{\varepsilon'} \rangle_{V', V},
\]

so that for any \( t_1, t_2 \in [0, T) \)

\[(3.2) \quad |g_\varepsilon(t_2) - g_{\varepsilon'}(t_2)|^2_H = |g_\varepsilon(t_1) - g_{\varepsilon'}(t_1)|^2_H + 2 \int_{t_1}^{t_2} \langle g_\varepsilon' - g_{\varepsilon'}, g_\varepsilon - g_{\varepsilon'} \rangle_{V', V} ds.
\]

Since \( g_\varepsilon \to g \) in \( L^2(0, T; V) \) and in \( V \) a.e. on \([0, T)\), we may fix \( t_1 \in [0, T) \) such that

\[(3.3) \quad g_\varepsilon(t_1) \to g(t_1) \quad \text{in} \quad H.
\]

As a consequence of (3.2), (3.3) as well as \( g_\varepsilon \to g \) in \( L^2(0, T; V) \) and \( g_\varepsilon' \to g' \) in \( L^2(0, T; V') \), we have

\[
\lim_{\varepsilon, \varepsilon' \to 0} \sup_{[0, T)} |g_\varepsilon(t) - g_{\varepsilon'}(t)|^2_H \leq \lim_{\varepsilon, \varepsilon' \to 0} \int_0^T \| g_\varepsilon' - g_{\varepsilon'} \|_{V'} \| g_\varepsilon - g_{\varepsilon'} \|_{V} ds = 0,
\]

so that \( (g_\varepsilon) \) is a Cauchy sequence in \( C([0, T); H) \), and then \( g_\varepsilon \) converges in \( C([0, T); H) \) to a limit \( \bar{g} \in C([0, T); H) \). That proves \( g = \bar{g} \) a.e. and \( g \in C([0, T); H) \).

**Step 2.** Similarly as for (3.2), we have

\[
|g_\varepsilon(t_2)|^2_H = |g_\varepsilon(t_1)|^2_H + 2 \int_{t_1}^{t_2} \langle g_\varepsilon', g_\varepsilon \rangle_{V'} ds,
\]

and passing to the limit \( \varepsilon \to 0 \) we get

\[
|g(t_2)|^2_H = |g(t_1)|^2_H + 2 \int_{t_1}^{t_2} \langle g', g \rangle_{V'} ds.
\]

Using again that \( \langle g', g \rangle \in L^1(0, T) \), we easily deduce from the above identity the two remaining claims of the Lemma. \( \square \)
3.3 A posteriori estimate, uniqueness and $C_0$-semigroup.

Taking $\varphi = g \in X_T$ as a test function in (3.1), we deduce from Lemma 3.3,
\[
\frac{1}{2}|g(t)|_H^2 - \frac{1}{2}|g_0|^2 = |g(t)|_H^2 - |g_0|^2 - \int_0^t \langle g'(s), g(s) \rangle \, ds
\]
\[
= \int_0^t \langle Ag, g \rangle \, ds
\]
\[
\leq \int_0^t (-\alpha \|g\|^2_V + b|g|^2_H^2) \, ds,
\]
and we then obtain (2.3) as an a posteriori estimate thanks to the Gronwall lemma 2.1.

Let us prove now the uniqueness of the variational solution $g$ associated to a given initial datum $g_0 \in H$. In order to do so, we consider two variational solutions $g$ and $f$ associated to the same initial datum. Since the equation (2.1), (2.2) is linear, or more precisely, the variational formulation (3.1) is linear in the solution, the function $g - f$ satisfies the same variational formulation (3.1) but associated to the initial datum $g_0 - f_0 = 0$. The a posteriori estimate (2.3) then holds for $g - f = 0$.

We finally explain how we may associate a $C_0$-semigroup to the evolution equation (2.1), (2.2) as a mere consequence of the linearity of the equation and of the existence and uniqueness result.

Definition 3.4 Consider $X$ a Banach space, and denote by $\mathcal{B}(X)$ the set of linear and bounded operators on $X$. We say that $S = (S_t)_{t \geq 0}$ is a strongly continuous semigroup of linear operators on $X$, or just a $C_0$-semigroup on $X$, if
(i) $\forall t \geq 0, \ S_t \in \mathcal{B}(X)$ (one parameter family of operators);
(ii) $\forall f \in X, \ t \mapsto S_t f \in C([0, \infty), X)$ (continuous trajectories);
(iii) $S_0 = I; \ \forall s, t \geq 0 \ S_{t+s} = S_t S_s$ (semigroup property).

For any $g_0 \in H$, we define $S_t g := g(t)$ where $g(t)$ is the unique variational solution associated to $g_0$.

- $S$ satisfies (i). By linearity of the equation and uniqueness of the solution, we clearly have
  \[ S_t (g_0 + \lambda f_0) = g(t) + \lambda f(t) = S_t g_0 + \lambda S_t f_0 \]
for any $g_0, f_0 \in H, \lambda \in \mathbb{R}$ and $t \geq 0$. Thanks to estimate (2.3), we also have $|S_t g_0| \leq e^{\lambda t} |g_0|$ for any $g_0 \in H$ and $t \geq 0$. As a consequence, $S_t \in \mathcal{B}(H)$ for any $t \geq 0$.
- $S$ satisfies (ii). Thanks to lemma 3.3, we have $t \mapsto S_t g_0 \in C(\mathbb{R}_+; H)$ for any $g_0 \in H$.
- $S$ satisfies (iii). For $g_0 \in H$ and $t_1, t_2 \geq 0$ denote $g(t) = S_t g_0$ and $\tilde{g}(t) := g(t + t_1)$. Making the difference of the two equations (3.1) written for $t = t_1$ and $t = t_1 + t_2$, we see that $\tilde{g}$ satisfies
  \[
  \langle \tilde{g}(t_2), \tilde{\varphi}(t_2) \rangle = (g(t_1), \varphi(t_1)) + \int_{t_1}^{t_1 + t_2} \left\{ \langle Ag(s), \varphi(s) \rangle + \langle \varphi'(s), g(s) \rangle \right\} \, ds
  \]
  \[
  = (\tilde{g}(0), \tilde{\varphi}(0)) + \int_0^{t_2} \left\{ \langle A\tilde{g}(s), \tilde{\varphi}(s) \rangle + \langle \tilde{\varphi}'(s), \tilde{g}(s) \rangle \right\} \, ds,
  \]
for any $\varphi \in X_{t_1 + t_2}$ with the notation $\tilde{\varphi}(t) := \varphi(t + t_1) \in X_{t_1}$. Since the equation on the functions $\tilde{g}$ and $\tilde{\varphi}$ is nothing but the variational formulation associated to the equation (2.1), (2.2), we obtain
  \[ S_{t_1 + t_2} g_0 = g(t_1 + t_2) = \tilde{g}(t_2) = S_{t_2} \tilde{g}(0) = S_{t_2} g(t_1) = S_{t_2} S_{t_1} g_0. \]
4 Proof of the existence part of Theorem 3.2.

We first prove thanks to a compactness argument in step 1 to step 3 that there exists a function $g \in L^2(0,T;V)$ such that

(4.1) \[
\langle g_0, \varphi(0) \rangle + \int_0^t \left\{ \langle \Lambda g(s), \varphi(s) \rangle_{V',V} + \langle \varphi'(s), g(s) \rangle_{V',V} \right\} \, ds = 0
\]

for any $\varphi \in C^1_c([0,T];V)$. We then deduce by some “regularization tricks” in step 4 and step 5 that the above weak solution is a variational solution.

**Step 1.** For a given $g_0 \in H$ and $\varepsilon > 0$, we seek $g_1 \in V$ such that

(4.2) \[
g_1 - \varepsilon \Lambda g_1 = g_0.
\]

We introduce the bilinear form $a : V \times V \to \mathbb{R}$ defined by

\[
a(u,v) := (u,v) - \varepsilon \langle \Lambda u,v \rangle.
\]

Thanks to the assumptions made on $\Lambda$, we have

\[
|a(u,v)| \leq |u||v| + \varepsilon M \|u\| \|v\|,
\]

and

\[
a(u,u) \geq |u|^2 + \varepsilon \alpha \|u\|^2 - \varepsilon b |u|^2 \geq \varepsilon \alpha \|u\|^2,
\]

whenever $\varepsilon b < 1$, what we assume from now. On the other hand, the mapping $v \in V \mapsto (g_0,v)$ is a linear and continuous form. We may thus apply the Lax-Milgram theorem, and we get

\[
\exists! g_1 \in V \quad (g_1,v) - \varepsilon \langle \Lambda g_1,v \rangle = (g_0,v) \quad \forall v \in V.
\]

**Step 2.** Fix $\varepsilon > 0$ as in the preceding step and build by induction the sequence $(g_k)$ in $V \subset H$ defined by the family of equations

(4.3) \[
\forall k \quad \frac{g_{k+1} - g_k}{\varepsilon} = \Lambda g_{k+1}.
\]

Observe that from the identity

\[
(g_{k+1},g_{k+1}) - \varepsilon \langle \Lambda g_{k+1}, g_{k+1} \rangle = (g_k,g_{k+1}),
\]

we deduce

\[
|g_{k+1}|^2 + \varepsilon \alpha \|g_{k+1}\|^2 - \varepsilon b |g_{k+1}|^2 \leq |g_k| |g_{k+1}|.
\]

As a consequence, we have

\[
|g_k| \leq \frac{1}{1 - \varepsilon b} |g_{k-1}| \leq \frac{1}{(1 - \varepsilon b)^k} |g_0| \leq A^{k \varepsilon} |g_0| \quad \forall k \geq 0,
\]

with $A := e^{2b}$ if $\varepsilon b \leq 1/2$, and then

\[
\alpha \sum_{j=1}^k \varepsilon \|g_j\|^2 \leq \sum_{j=1}^k \frac{1}{2} (|g_{j-1}|^2 - |g_j|^2) + b \sum_{j=1}^k \varepsilon |g_j|^2
\]

\[
\leq \frac{1}{2} |g_{k-1}|^2 + b \sum_{j=1}^k \varepsilon |g_j|^2
\]

\[
\leq \frac{A^{2(k-1)\varepsilon}}{2} |g_0|^2 + \varepsilon b \frac{A^{2\varepsilon(k+1)} - 1}{A^{2\varepsilon} - 1} |g_0|^2 \quad \forall k \geq 0.
\]

We fix $T > 0$, $n \in \mathbb{N}^*$ and we define

\[
\varepsilon := T/n, \quad t_k = k \varepsilon, \quad g^\varepsilon(t) := g_k \text{ on } [t_k, t_{k+1}).
\]
The two precedent estimates write then
\[(4.4)\]
\[
\sup_{[0,T]} |g^\varepsilon|^2 + \alpha \int_0^T \|g^\varepsilon\|^2 \, dt \leq \frac{b}{2} A^{2(T+1)} + \frac{3}{2} A^{2T}.
\]

**Step 3.** Consider a test function \(\varphi \in C^1_0([0,T); V)\) and define \(\varphi_k := \varphi(t_k)\). Multiplying the equation \[(4.3)\]
by \(\varphi_k\) and summing up from \(k = 0\) to \(k = n\), we get
\[-\langle \varphi_0, g_0 \rangle - \sum_{k=1}^n \langle \varphi_k - \varphi_{k-1}, g_k \rangle = \sum_{k=0}^n \varepsilon \langle \varphi_k, \Lambda g_{k+1} \rangle.\]
Introducing the two functions \(\varphi^\varepsilon, \varphi_\varepsilon : [0,T) \to V\) defined by
\[
\varphi^\varepsilon(t) := \varphi_{k-1} \quad \text{and} \quad \varphi_\varepsilon(t) := \frac{t_{k+1} - t}{\varepsilon} \varphi_k + \frac{t - t_k}{\varepsilon} \varphi_{k+1} \quad \text{for} \quad t \in [t_k, t_{k+1}),
\]
in such a way that
\[
\varphi'_\varepsilon(t) = \frac{\varphi_{k+1} - \varphi_k}{\varepsilon} \quad \text{for} \quad t \in (t_k, t_{k+1}),
\]
the above equation also writes
\[(4.5)\]
\[-\langle \varphi(0), g_0 \rangle - \int_0^T \langle \varphi'_\varepsilon, g^\varepsilon \rangle \, dt = \int_0^T \langle \varphi_\varepsilon, \Lambda g^\varepsilon \rangle \, dt.\]
On the one hand, from \[(4.4)\], we know that up to the extraction of a subsequence, there exists \(g \in Y_T\) such that \(g^\varepsilon \rightharpoonup g\) weakly in \(L^2(0,T; V)\). On the other hand, from the above construction, we have \(\varphi'_\varepsilon \to \varphi'\) and \(\varphi_\varepsilon \to \varphi\) both strongly in \(L^2(0,T; V)\). We may then pass to the limit as \(\varepsilon \to 0\) in \[(4.5)\] and we get \[(4.1)\].

**Step 4.** We prove that \(g \in X_T\). Taking \(\varphi := \chi(t) \psi\) with \(\chi \in C^1_0((0,T))\) and \(\psi \in V\) in equation \[(4.1)\], we get
\[
\left\langle \int_0^T g \psi' \, dt, \psi \right\rangle = \int_0^T \langle g, \psi \rangle \chi' \, dt = -\int_0^T \langle \Lambda g, \psi \rangle \chi \, dt = -\int_0^T \Lambda g \chi \, dt, \psi \right\rangle.
\]
This equation holding true for any \(\psi \in V\), it is equivalent to
\[
\int_0^T g \psi' \, dt = -\int_0^T \Lambda g \chi \, dt \quad \text{in} \quad V' \quad \text{for any} \quad \chi \in D(0,T),
\]
or in other words
\[
g' = \Lambda g \quad \text{in the sense of distributions in} \quad V'.
\]
Since \(g \in L^2(0,T; V)\), we get that \(\Lambda g \in L^2(0,T; V')\) and the above relation precisely means that \(g \in H^1(0,T; V')\). We conclude thanks to Lemma \[3.3\] that \(g \in X_T\).

**Step 5.** Assume first \(\varphi \in C_c([0,T]; H) \cap L^2(0,T; V) \cap H^1(0,T; V')\). We define \(\varphi_\varepsilon(t) := \varphi \ast \rho_\varepsilon\) for a mollifier \((\rho_\varepsilon)\) with compact support included in \((0, \infty)\) so that \(\varphi_\varepsilon \in C^1_c([0,T); V)\) for any \(\varepsilon > 0\) small enough and
\[
\varphi_\varepsilon \to \varphi \quad \text{in} \quad C([0,T]; H) \cap L^2(0,T; V) \cap H^1(0,T; V').
\]
Writing the equation \[(4.1)\] for \(\varphi_\varepsilon\) and passing to the limit \(\varepsilon \to 0\) we get that \[(4.1)\] also holds true for \(\varphi\).

Assume next that \(\varphi \in X_T\). We fix \(\chi \in C^1(\mathbb{R})\) such that \(\text{supp} \, \chi \subset (-\infty,0), \chi' \leq 0, \chi' \in C_c([-1,0])\) and \(\int_0^1 \chi' = -1\), and we define \(\chi_\varepsilon(t) := \chi((t - T)/\varepsilon)\) so that \(\varphi_\varepsilon := \varphi \chi_\varepsilon \in C^1_c([0,T); H)\) and \(\chi_\varepsilon \to 1_{[0,T]}, \chi'_\varepsilon \to -\delta_T\) as \(\varepsilon \to 0\). Equation \[(4.1)\] for the test function \(\varphi_\varepsilon\) writes
\[
-\langle g_0, \varphi(0) \rangle - \int_0^T \chi_\varepsilon \langle \varphi_\varepsilon, g \rangle \, ds = \int_0^T \chi_\varepsilon \left\{ \langle \Lambda g, \varphi \rangle + \langle \varphi_\varepsilon, g \rangle \right\} \, ds,
\]
and we obtain the variational formulation \[(3.1)\] for \(t_1 = 0\) and \(t_2 = T\) by passing to the limit \(\varepsilon \to 0\) in the above equation. \(\square\)
5 Exercises

Exercise 5.1 Prove that \( f \geq 0 \) if \( f_0 \geq 0 \). (Hint. Show that the sequence \( (g_k) \) defined in step 2 of the proof of the existence part is such that \( g_k \geq 0 \) for any \( k \in \mathbb{N} \)).

Exercise 5.2 Prove the existence of a solution \( g \in X_T \) to the equation

\[
\frac{dg}{dt} = \Lambda g + G \quad \text{in} \quad (0,T), \quad g(0) = g_0,
\]

for any initial datum \( g_0 \in H \) and any source term \( G \in L^2(0,T;V') \).

(Ind. Repeat the same proof as for the Theorem 3.2 where for the a priori bound one can use

\[
\int_0^T \langle g, G \rangle \, dt \leq \frac{\alpha}{2} \int_0^T \| g(t) \|_V^2 \, dt + \frac{1}{2\alpha} \int_0^T \| G(t) \|_{V'}^2 \, dt,
\]

and for the approximation scheme one can define

\[
\varepsilon^{-1} (g_{k+1} - g_k) = \Lambda g_{k+1} + G_k, \quad G_k := \int_{t_k}^{t_{k+1}} G(s) \, ds.
\]

Exercise 5.3 Generalize the existence and uniqueness result to the PDE equation

\[
\partial_t g = a_{ij} \partial_{ij} g + b_i \partial_i g + cg + \int k(t,x,y) \, g(t,y) \, dy
\]

where \( a_{ij}, b_i, c \) and \( k \) are times dependent coefficients and where \( a_{ij} \) is uniformly elliptic in the sense that

\[
\forall t \in (0,T), \ \forall \xi \in \mathbb{R}^d \quad a_{ij} \xi_i \xi_j \geq \alpha |\xi|^2, \quad \alpha > 0.
\]

Exercise 5.4 Let \( \Omega \subset \mathbb{R}^d \) an open connected set or the torus. We define

\[
H := \{ u \in L^2(\mathbb{R}^d); \text{ div} u = 0 \}, \quad V := \{ u \in H^1(\mathbb{R}^d); \text{ div} u = 0 \}.
\]

1) - Prove that for any \( u_0 \in H \) there existe a unique fonction \( u \in X_T \) solution of the variationnal equation

\[
\int_\Omega u(T) \cdot \varphi(T) - \int_\Omega u_0 \cdot \varphi(0) = \int_0^T \int_\Omega D u : D \varphi \, dx \quad \forall \varphi \in X_T.
\]

2) (a) - Prove that \( T \in D'(\Omega) \), \( \text{ div} T = 0 \) implies \( T = C \).

(b) - Prove the Poincaré-Wirtinger inequality

\[
\forall v \in H^1(\Omega) \quad \| v - \bar{u} \|_{L^2} \leq C \| \nabla u \|_{L^2}, \quad \bar{u} := \int_\Omega u \, dx.
\]

(c) - Assume \( \Omega \) bounded and deduce the following inequality

\[
\forall T \in H^{-1}(\Omega), \ T \perp H, \ \exists p \in L^2(\Omega), \ T = \nabla p, \ \| p \|_{L^2} \leq C \| T \|_{H^{-1}}.
\]

3) (a) - Assume that \( \Omega \) is the torus and prove that the solution \( u \) of (5.2) satisfies

\[
\int_\Omega u(T) \cdot \varphi(T) - \int_\Omega u_0 \cdot \varphi(0) = \int_0^T \int_\Omega D u : D \varphi \, dx \quad \forall \varphi \in L^2(0,T;H^1) \cap C([0,T];L^2).
\]

(Ind. Define \( \Pi := I + \nabla (\nabla (-\Delta)^{-1} \text{ div} \) the projector on divergence-free vectors and observe that for any \( \varphi \in H^1(\Omega) \) and any \( u \in H \) there holds \( \langle u, \varphi \rangle = \langle u, \Pi \varphi \rangle \).)

(b) Deduce that there exists a fonction \( p \in L^2((0,T) \times \Omega) \) such that \( u \) satisfies

\[
\partial_t u = \Delta u + \nabla p \quad \text{in} \quad (0,T) \times \Omega.
\]
